## PROFESSIONAL DEVELOPMENT PROGRAM

### The most common challenges in melanoma diagnosis and how to avoid them

Ashfaq A Marghoob,<sup>1</sup> Lily Changchien,<sup>1</sup> Jennifer DeFazio,<sup>1</sup> Whitney C Desso,<sup>2</sup> Josep Malvehy,<sup>3</sup>  
Iris Zalaudek,<sup>4</sup> Allan C Halpern<sup>1</sup> and Alon Scope<sup>1</sup>

#### One of the common scenario:

- *Misdiagnosis of nodular melanoma as a benign lesion by the dermatologist*
- *...amelanotic lesions, which are more challenging...*

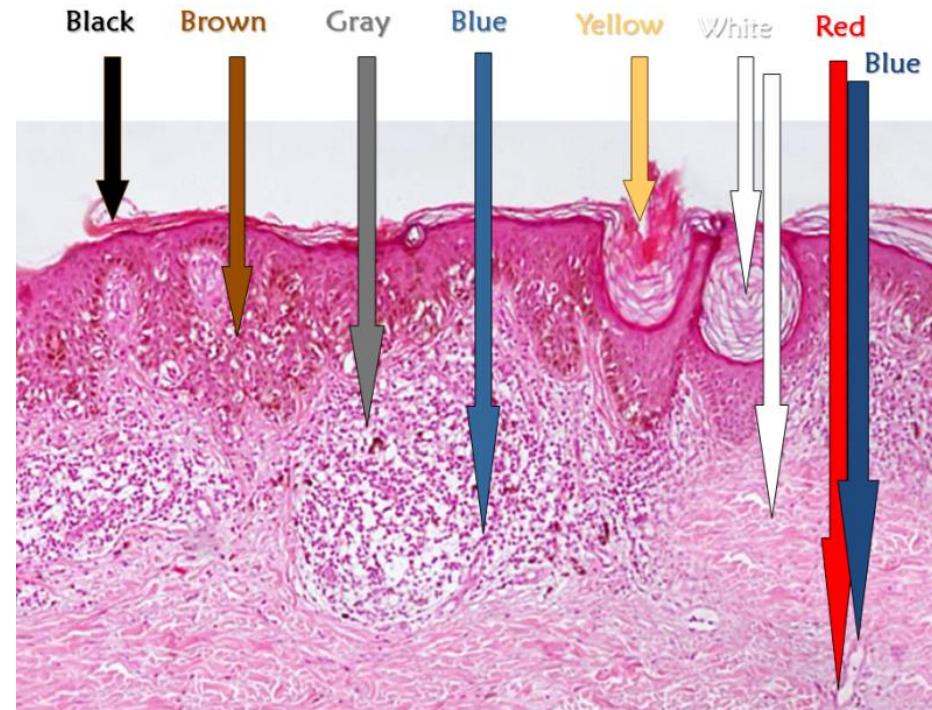

## Amelanotic melanoma: The great masquerader

- Amelanotic melanoma accounts for 2-8% of all melanomas
- the real incidence is difficult to estimate due to misdiagnosis
- clinical recognition is particularly difficult, since it might mimic several benign hypo-/non-pigmented skin lesions
- often resulting in a significant delay in diagnosis and deterioration of prognosis

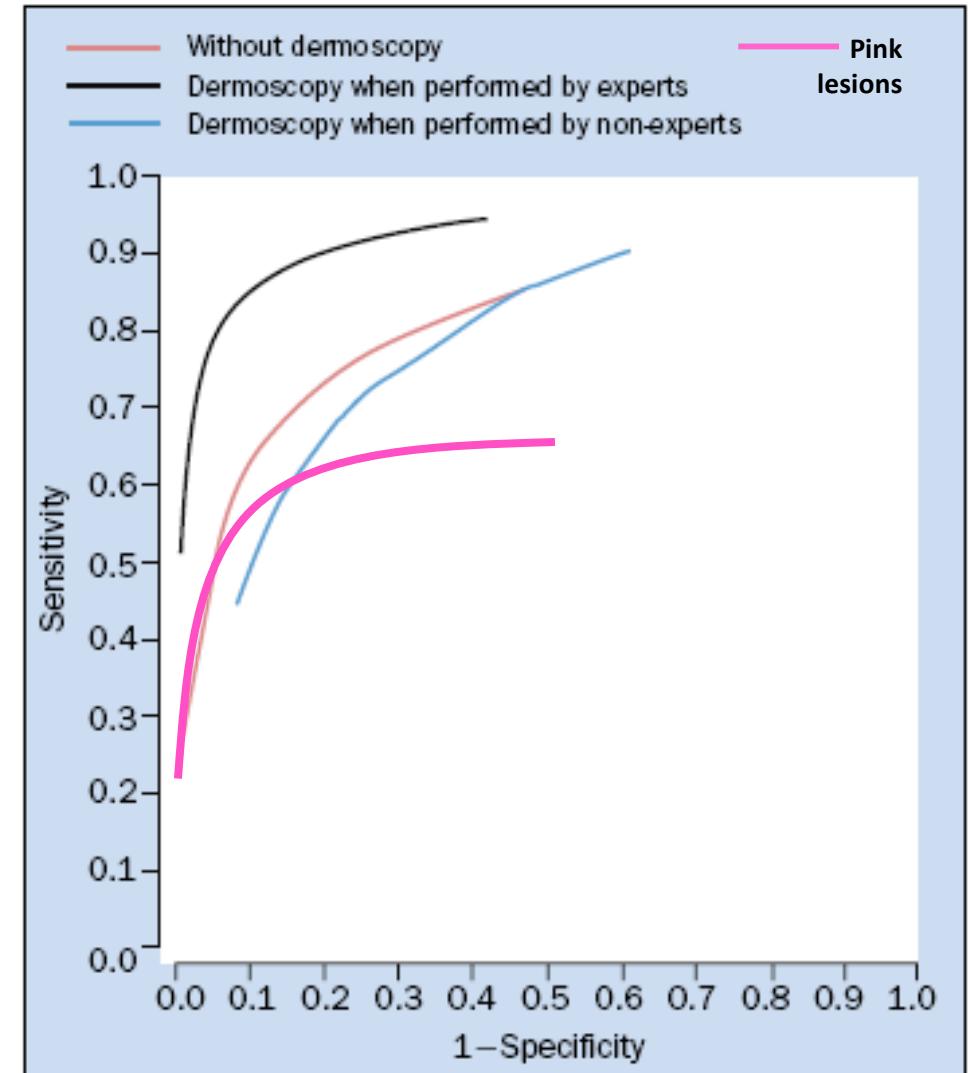

# Pink / featureless lesions

- Since the vast majority of melanoma-associated dermoscopic structures are pigmented,
- amelanotic melanoma is usually dermoscopically “**featureless**” and thus difficult to recognize

# Pink / featureless lesions

- Diminuzione dell'accuratezza diagnostica

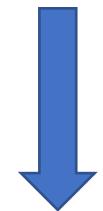

---

# Clinically and dermoscopically featureless melanoma: When prevention fails

Paolo Carli, MD,<sup>a</sup> Daniela Massi, MD,<sup>b</sup> Vincenzo de Giorgi, MD,<sup>a</sup> and Benvenuto Giannotti, MD<sup>a</sup>

- lesions that frequently do not look like melanoma, but mimic a variety of other malignant or benign lesions
- what to do when the lesion is not recognized as suspect?
- Systematic study of clinical and dermoscopic characteristics of false-negative melanoma cases

Featureless

**FALSE -  
NEGATIVE**

# Pink / featureless lesions

## 1. Pattern Vascolari

Dermoscopic analysis of skin tumors in the past has mainly focused on pigmented structures. Features of vascularization received surprisingly little interest, although in the clinical diagnosis, one of the clues for basal-cell carcinoma (BCC) is the visible presence of blood vessels (telangiectasia). Findings in blood vessels yield additional information for the diagnosis of poorly pigmented tumors. Frequently, these lesions are difficult to diagnose due to lack of features from pigmented structures. Only in the early years of skin microscopy did blood vessels receive great attention.<sup>1</sup> In those days, however, interest focused on their value for diagnosing psychiatric and internal diseases rather than skin tumors. This article gives an

# Pattern Vascolare della cute normale

# Correlazioni dermoscopico-patologiche

## Pattern vascolare

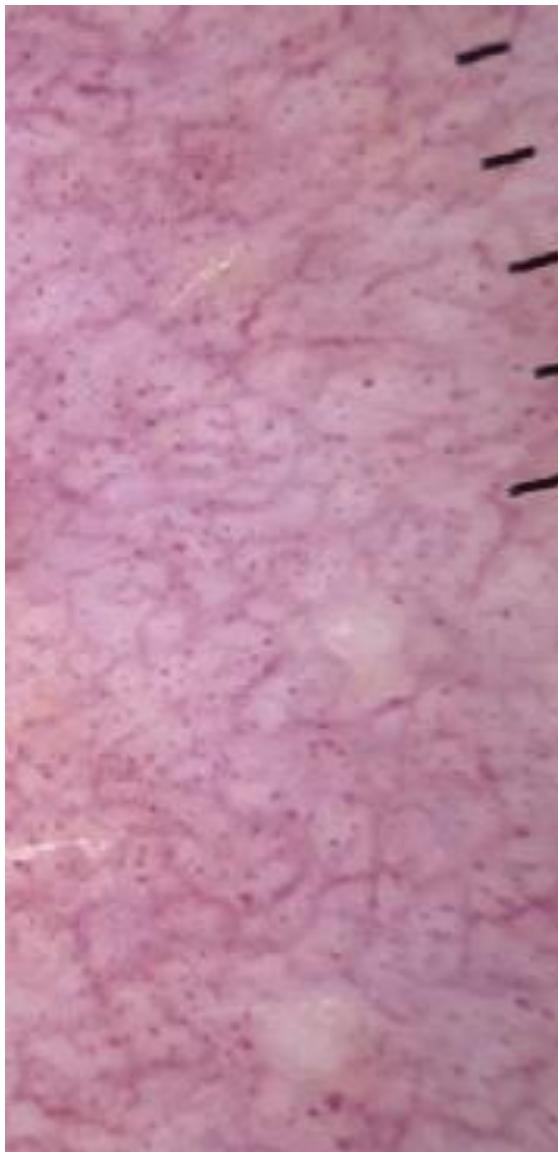

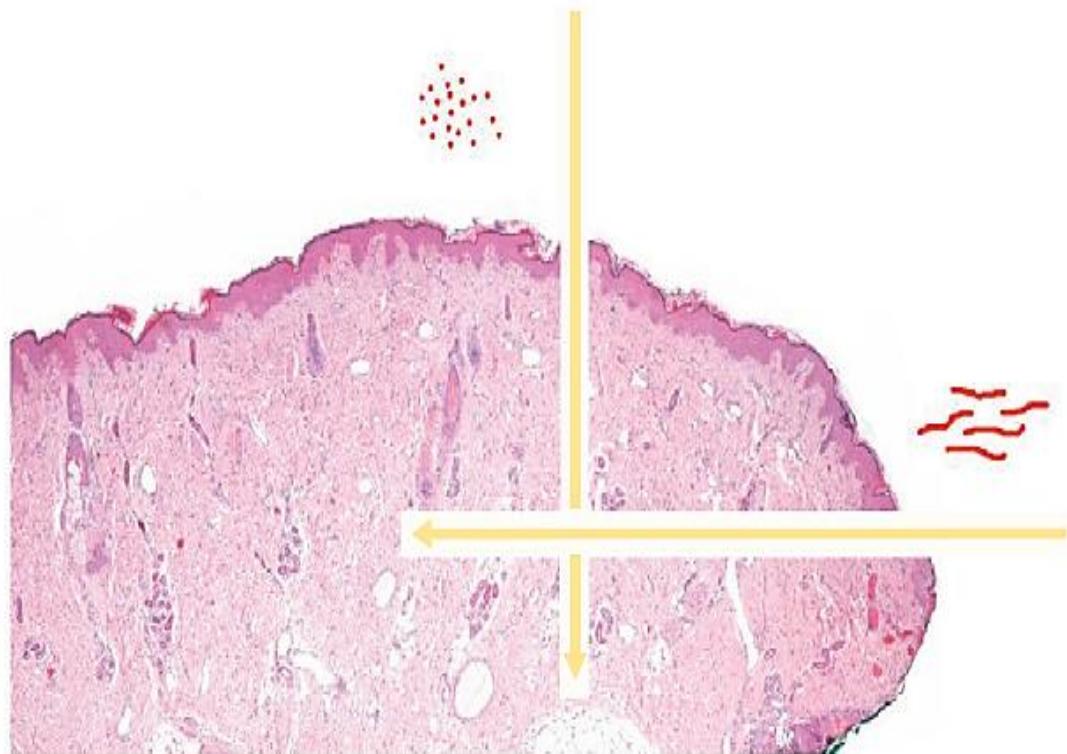

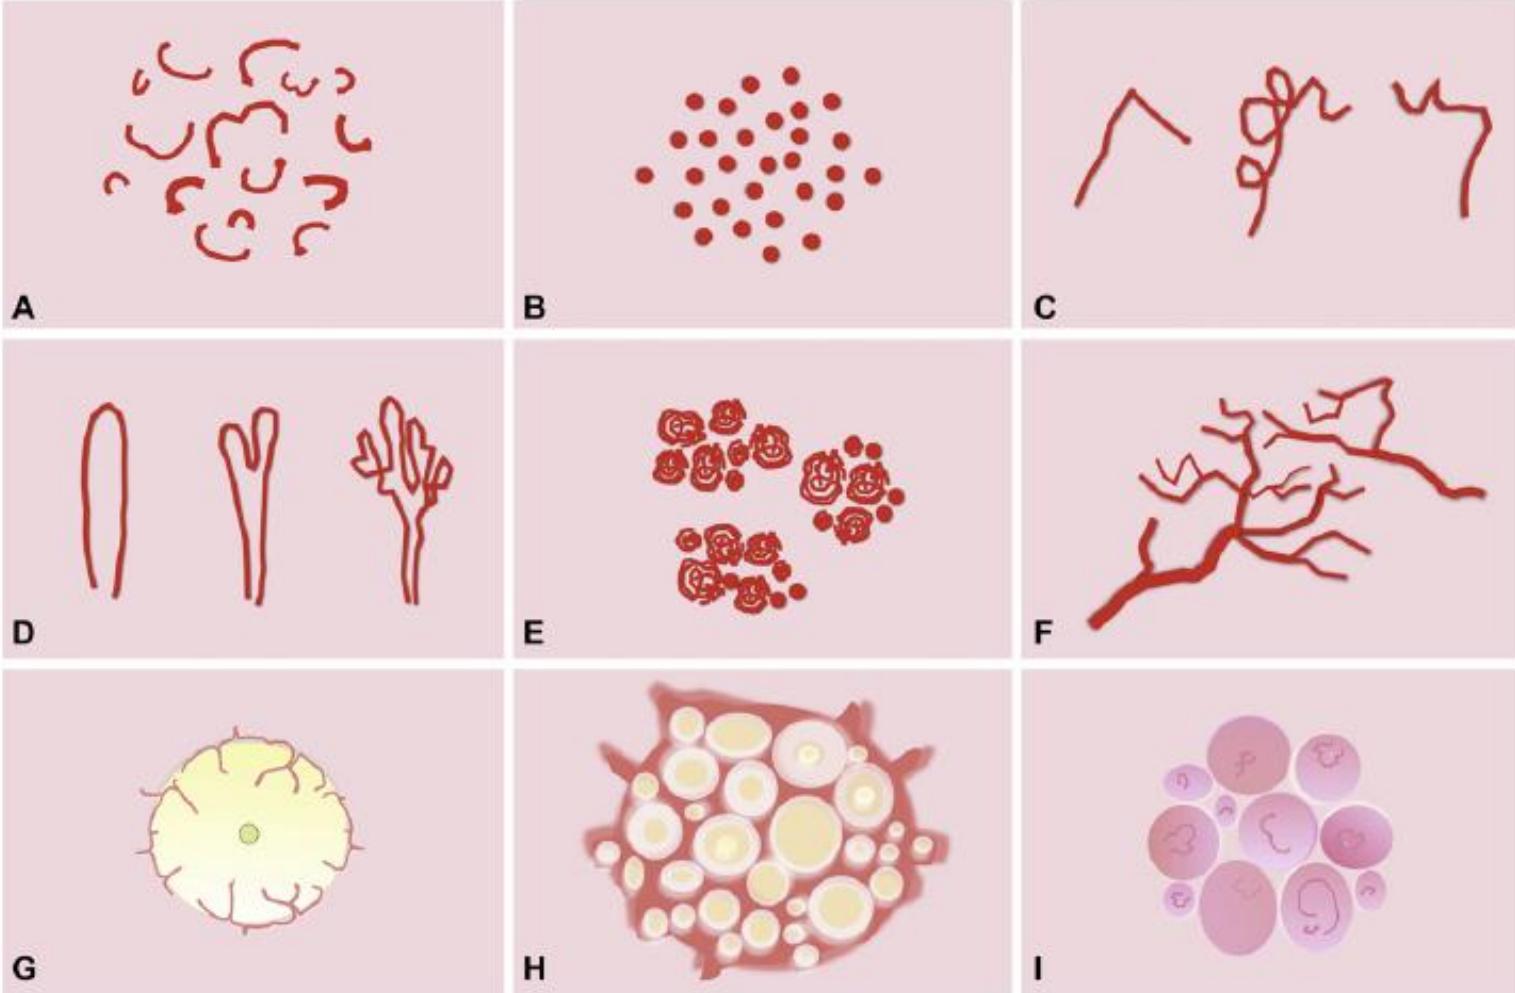

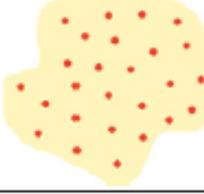

Figure 1 Dermoscopic morphologic features of vessels according to their location in the skin.

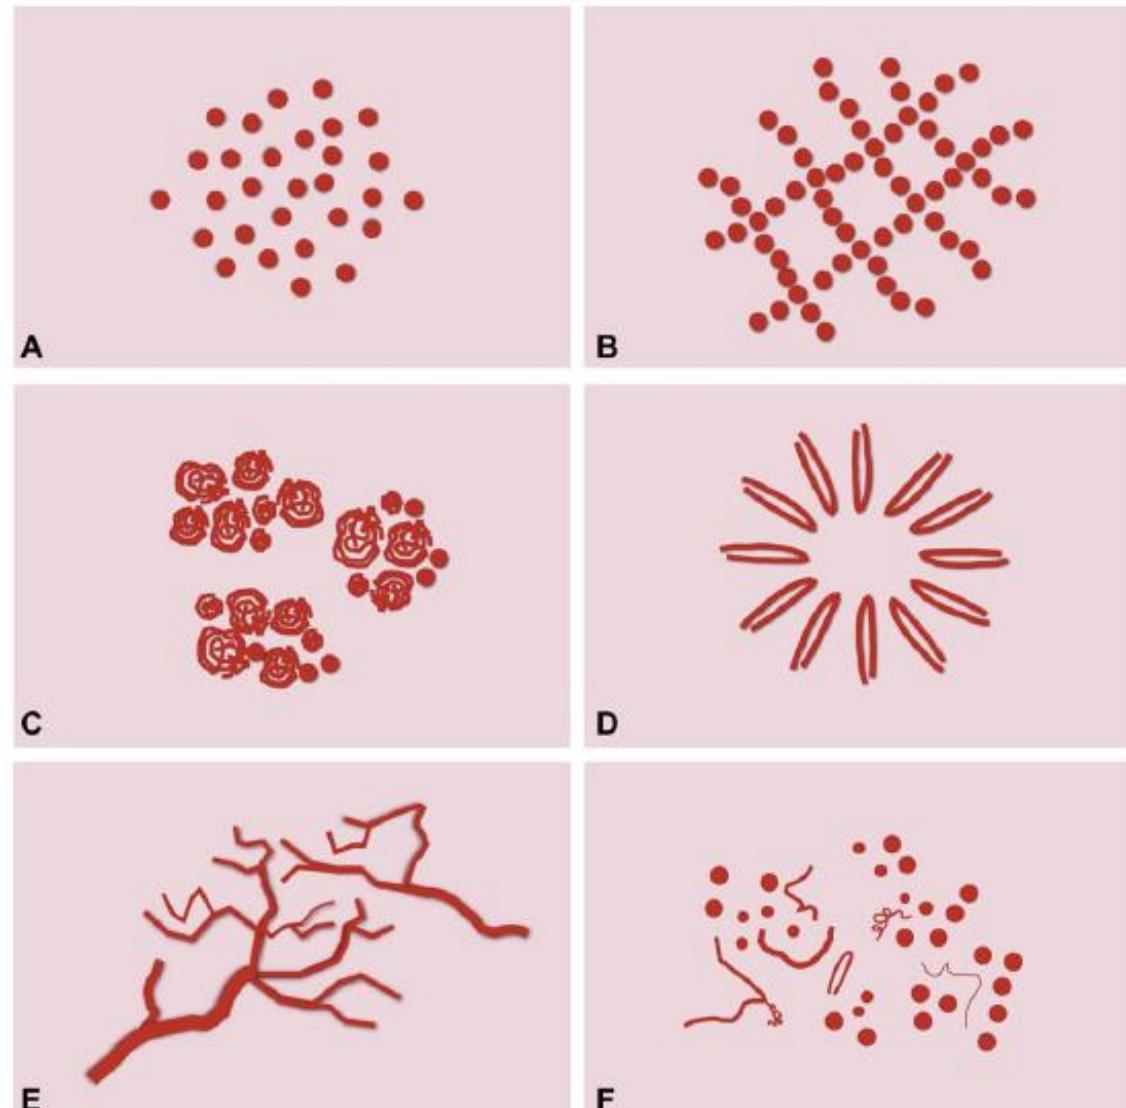

# Morfologia delle strutture vascolari

Vascular Pattern	Description	Interpretation	Diagram
Arborizing vessels or telangiectasias	In-focus large-caliber vessels that branch into finer secondary vessels	- Basal cell carcinoma - Adnexal tumors	
Hairpin vessels	Vessels that double back on themselves and are seen as loops when they are oblique to the surface of the lesion; in keratinizing tumors, they are surrounded by a hypopigmented halo	- Regular: seborrheic keratosis  - Irregular: melanoma, Spitz nevus, and keratoacanthoma	
Crown vessels	Barely branching peripheral vessels that do not cross the center of the lesion	- Sebaceous hyperplasia  - Molluscum contagiosum	
Comma vessels	Thick, linear curved lines with little branching and occasionally one end that is thicker than the other	- Compound or dermal nevus	
Dotted vessels	Small-caliber reddish vessels that resemble a pinhead	- Spitz nevus - Melanoma - Inflammatory lesions	
Glomerular vessels	Larger-caliber reddish dots formed by tortuous capillaries curled up into a ball or resembling the glomerular apparatus of the kidneys	- Bowen disease - Stasis dermatitis	
Corkscrew vessels	Linear irregular spiral vessels areas containing atypical linear vessels	- Melanoma - Melanoma metastasis	
Milky-red areas/globules	Out-of-focus pink-reddish oval or polygonal areas containing atypical linear vessels	- Melanoma	
Strawberry pattern	Structureless erythematous areas with heterogeneous whitish areas forming a type of pseudonetwork	- Melanoma - Superficial basal cell carcinoma	
Linear irregular vessels	Straight vessels varying in shape and size	- Melanoma	
Polymorphous vessels	Different vascular morphologies in the same lesion	- Melanoma - Carcinomas	

# Disposizione delle strutture vascolari

Vascular Pattern	Description	Example	Diagram
<b>Regular</b>	Vessels distributed evenly through the lesion	- Spitz nevus	
<b>String of pearls</b>	Dotted vessels arranged linearly in a pattern that resembles a string of pearls	- Clear-cell acanthoma	
<b>Clustered</b>	With a tendency to group together in a lesional area	- Bowen disease	
<b>Radial</b>	Presence of vessels only at the periphery of the lesion; they do not occupy or cross the center	- Sebaceous hyperplasia	
<b>Branching</b>	Large vessels that branch into smaller vessels	- Basal cell carcinoma	
<b>Irregular</b>	Vascular polymorphism without a specific pattern	- Melanoma	
<b>Rope-ladder pattern</b>	Short, slightly dilated loops that emerge from the edges of the scar and cross it completely	- Scar

Red homogeneous color

Corkscrew

Polymorphous (atypical) vascular pattern

## Vascular Pattern

Regular

## Definition

Vessels that are arranged fairly regularly throughout lesion (eg, the arrangement of hairpin vessels in SK, comma vessels in dermal nevi, and dot vessels in Spitz nevus or thin AHM)

Irregular

Vessels distributed irregularly throughout tumor; for example, polymorphous vessels in invasive SCC or melanoma (pictured) or the irregular distribution of arborizing telangiectasias in BCC

Clustered

Pattern wherein vessels are arranged in clustered groups, classically referring to glomerular vessels in Bowen disease

Stringlike (or reticular)

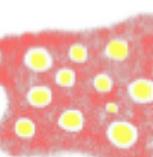

Vessels arranged in lines, which may crisscross to form a peculiar reticular pattern; usually refers to the distribution of dotted and/or tortuous (ie, coiled or glomerular) vessels in CCA, but this pattern may also be seen in LCA

Radial

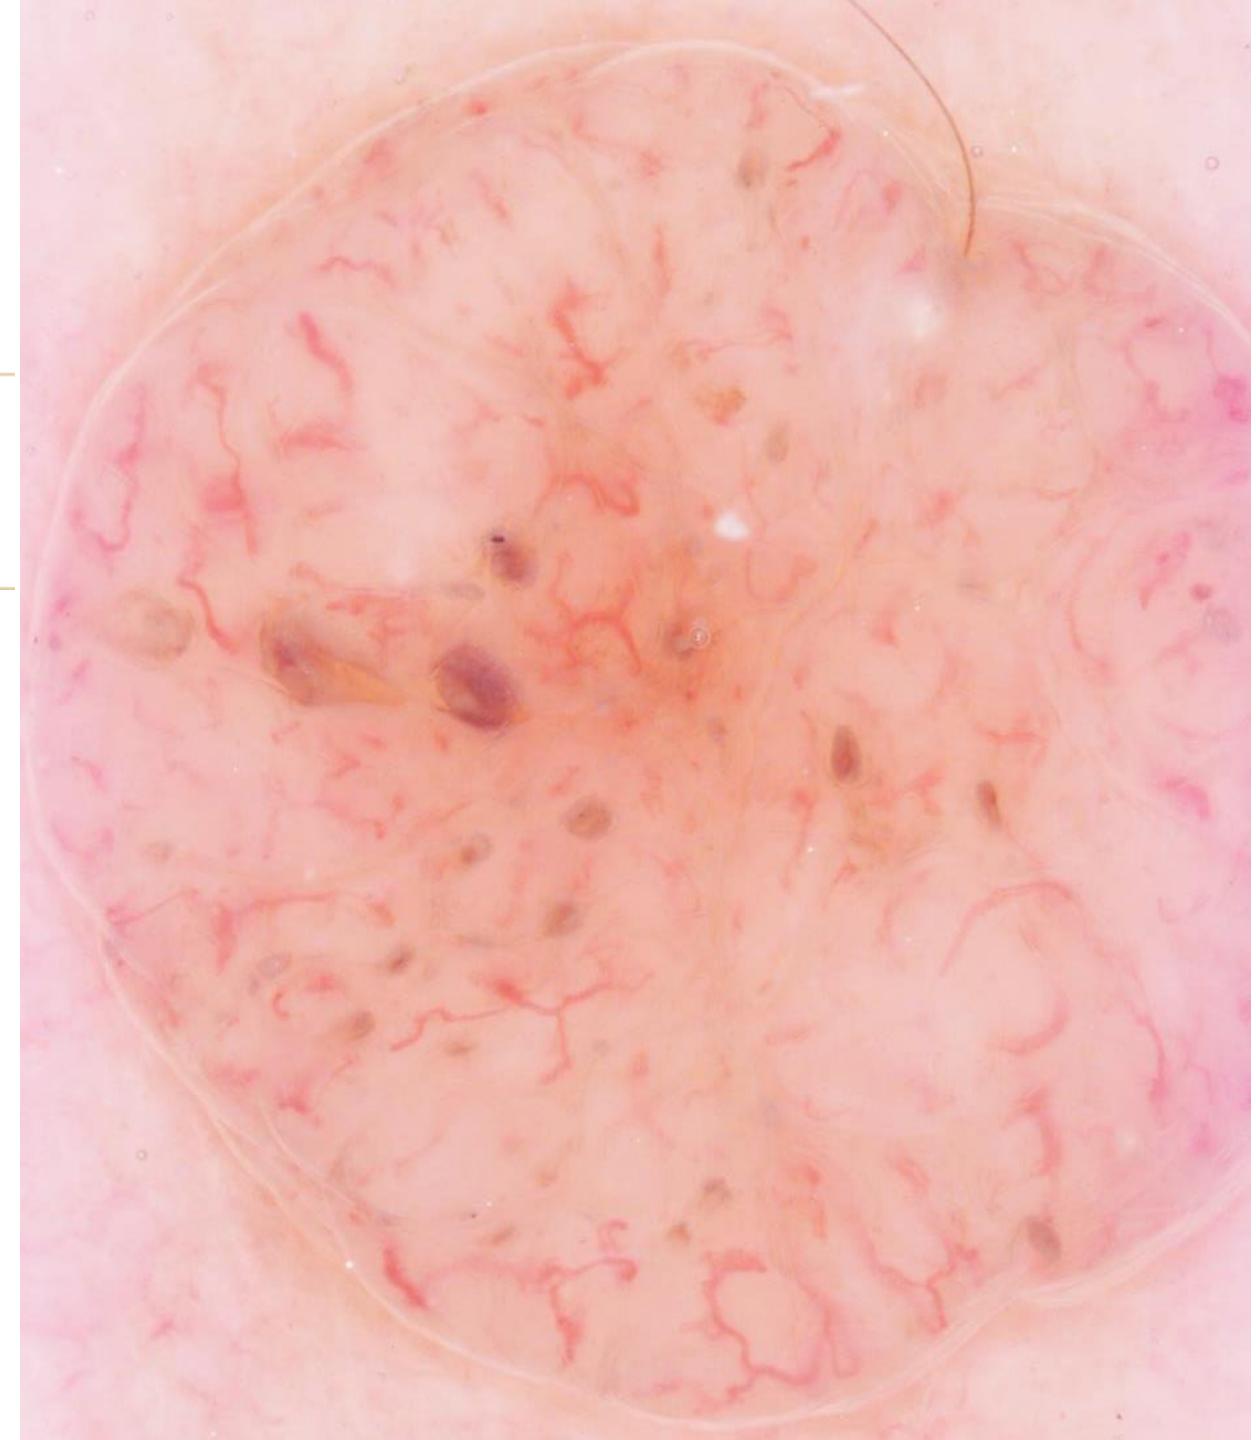

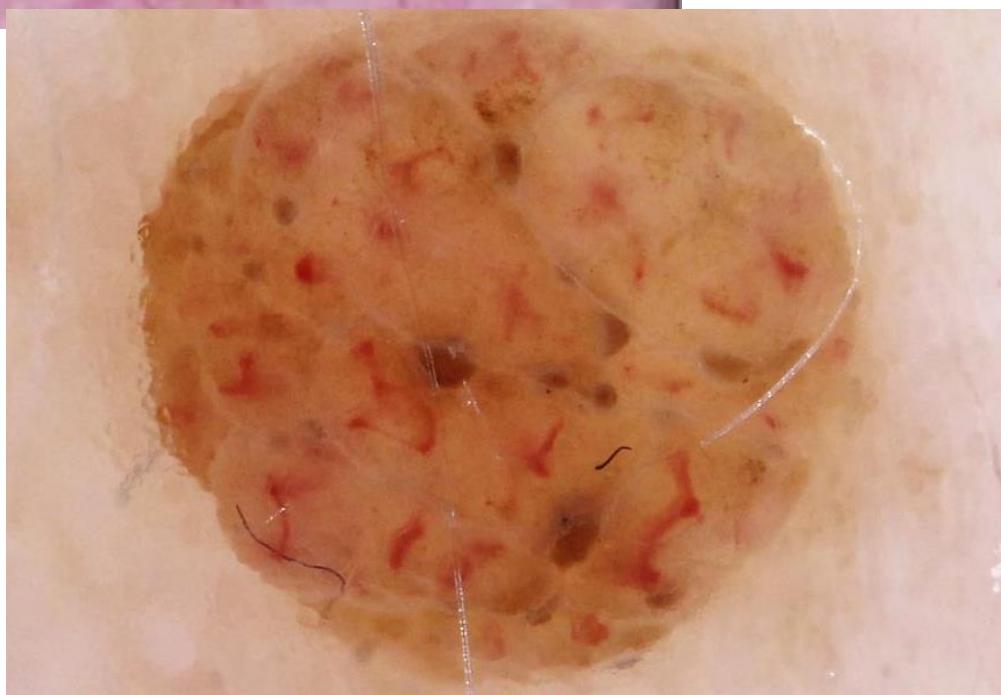

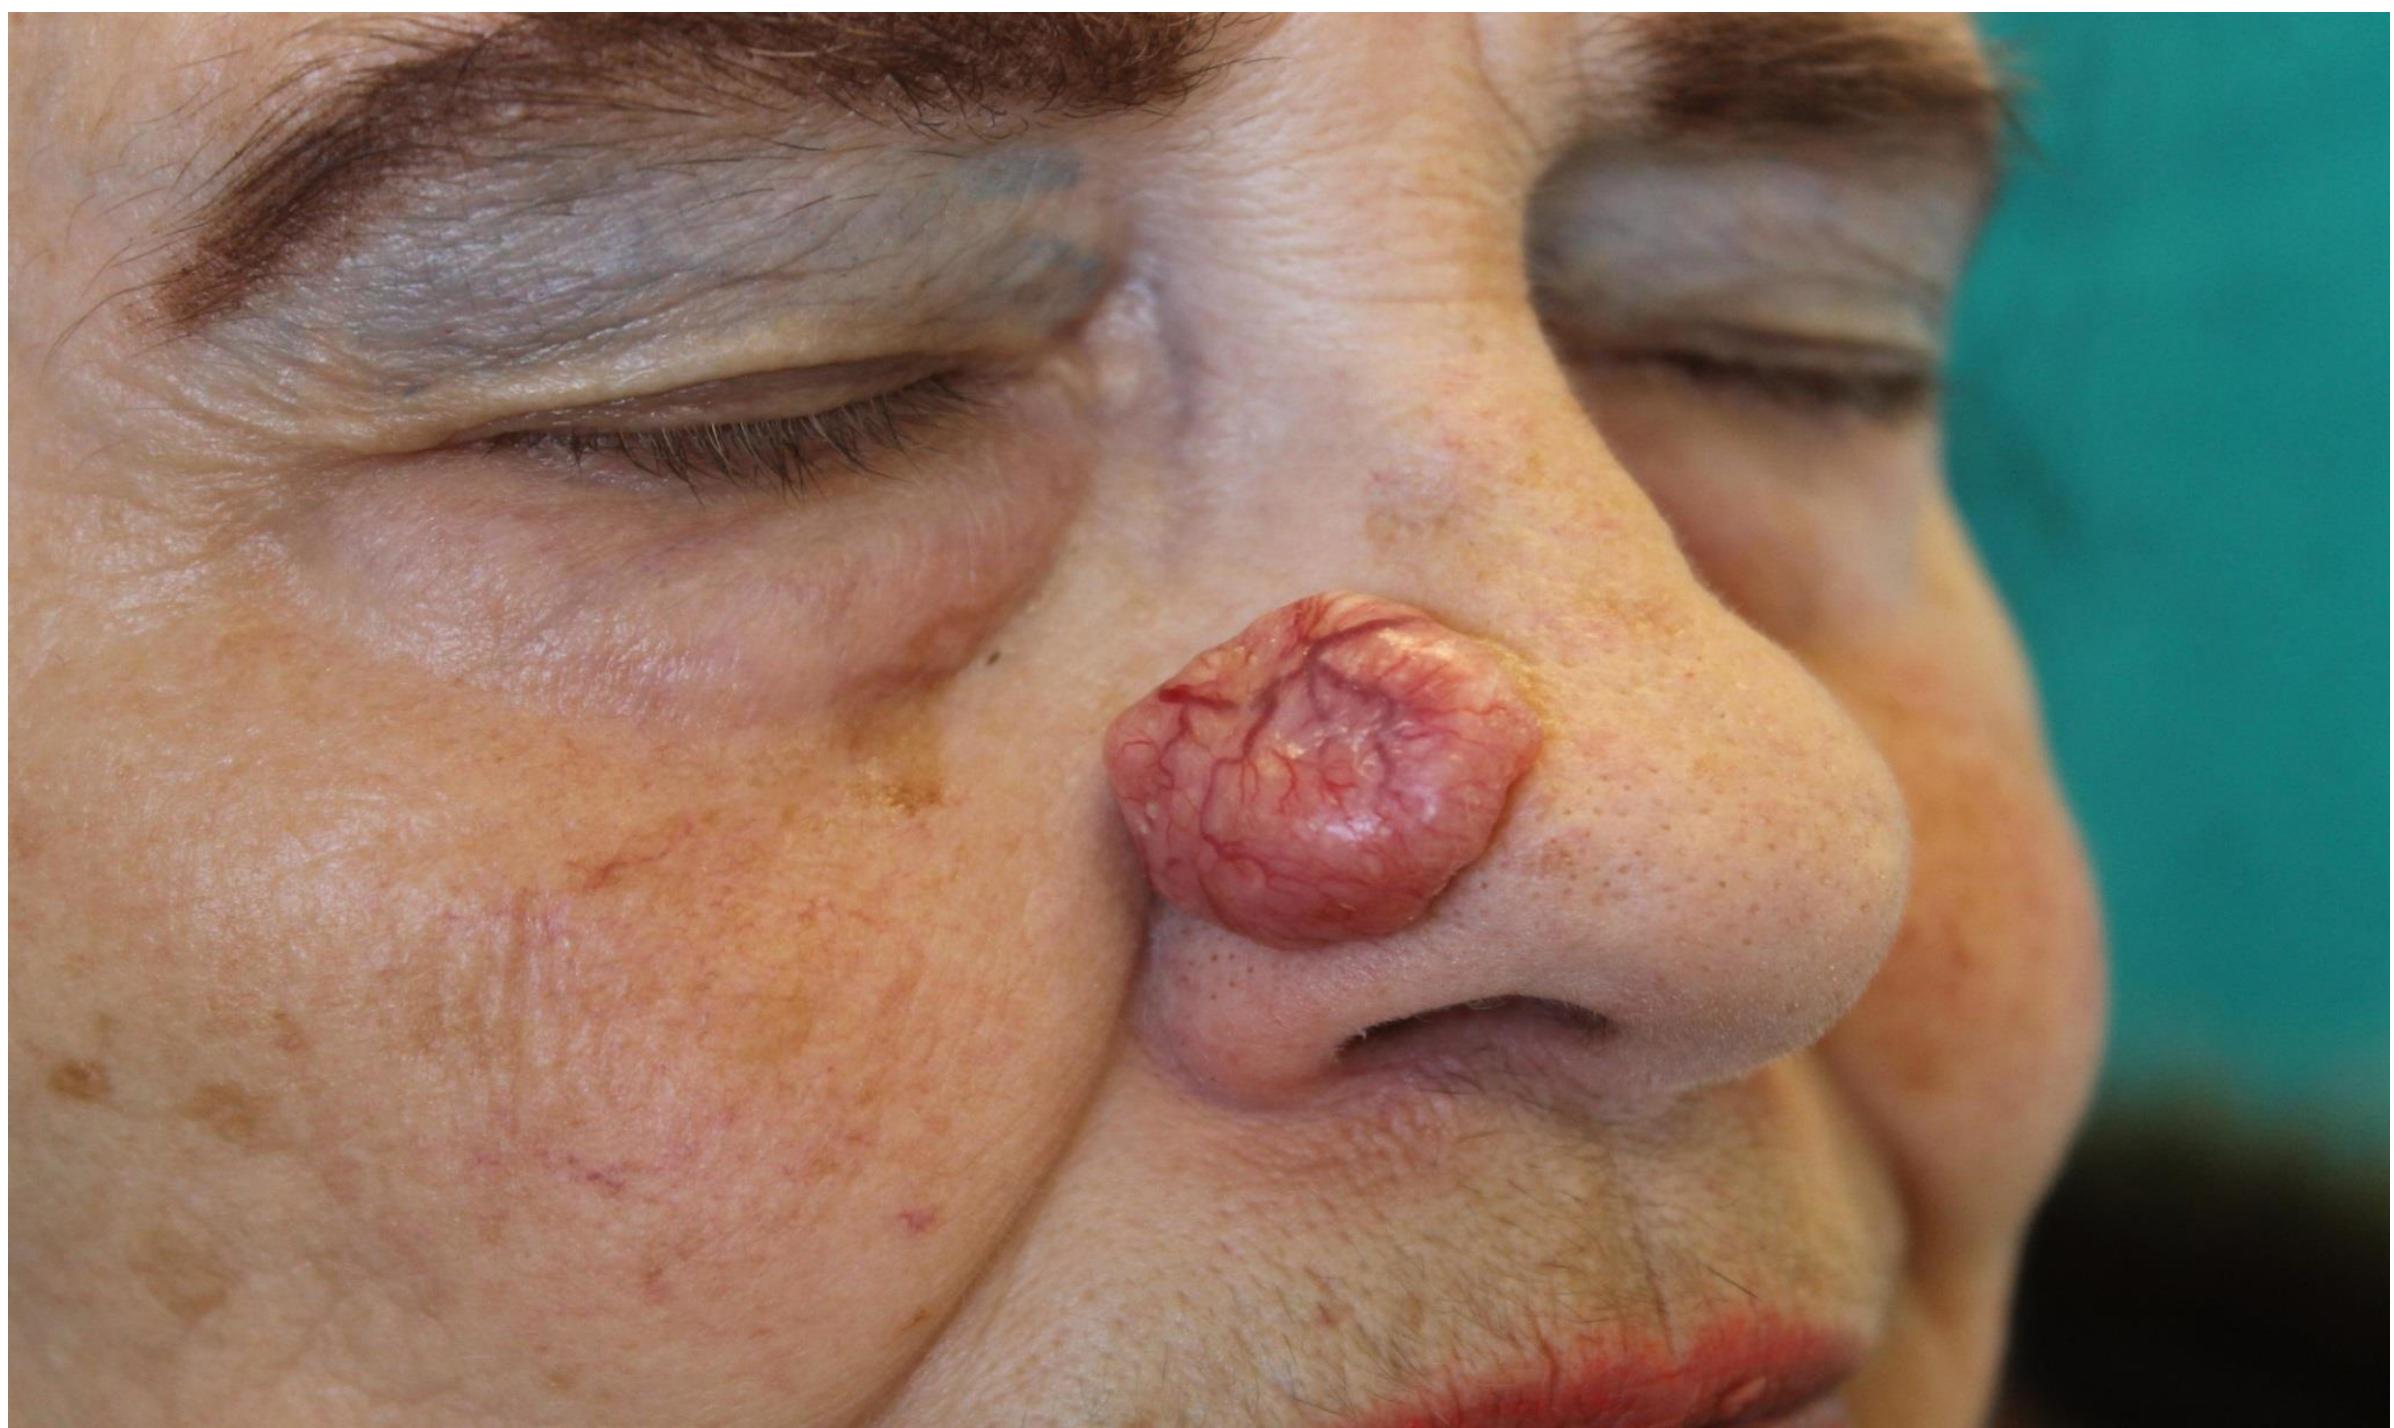

Vessels are distributed around the periphery of the tumor; stereotypical example, radial arrangement of hairpin vessels in KA (surrounding a central keratin mass)

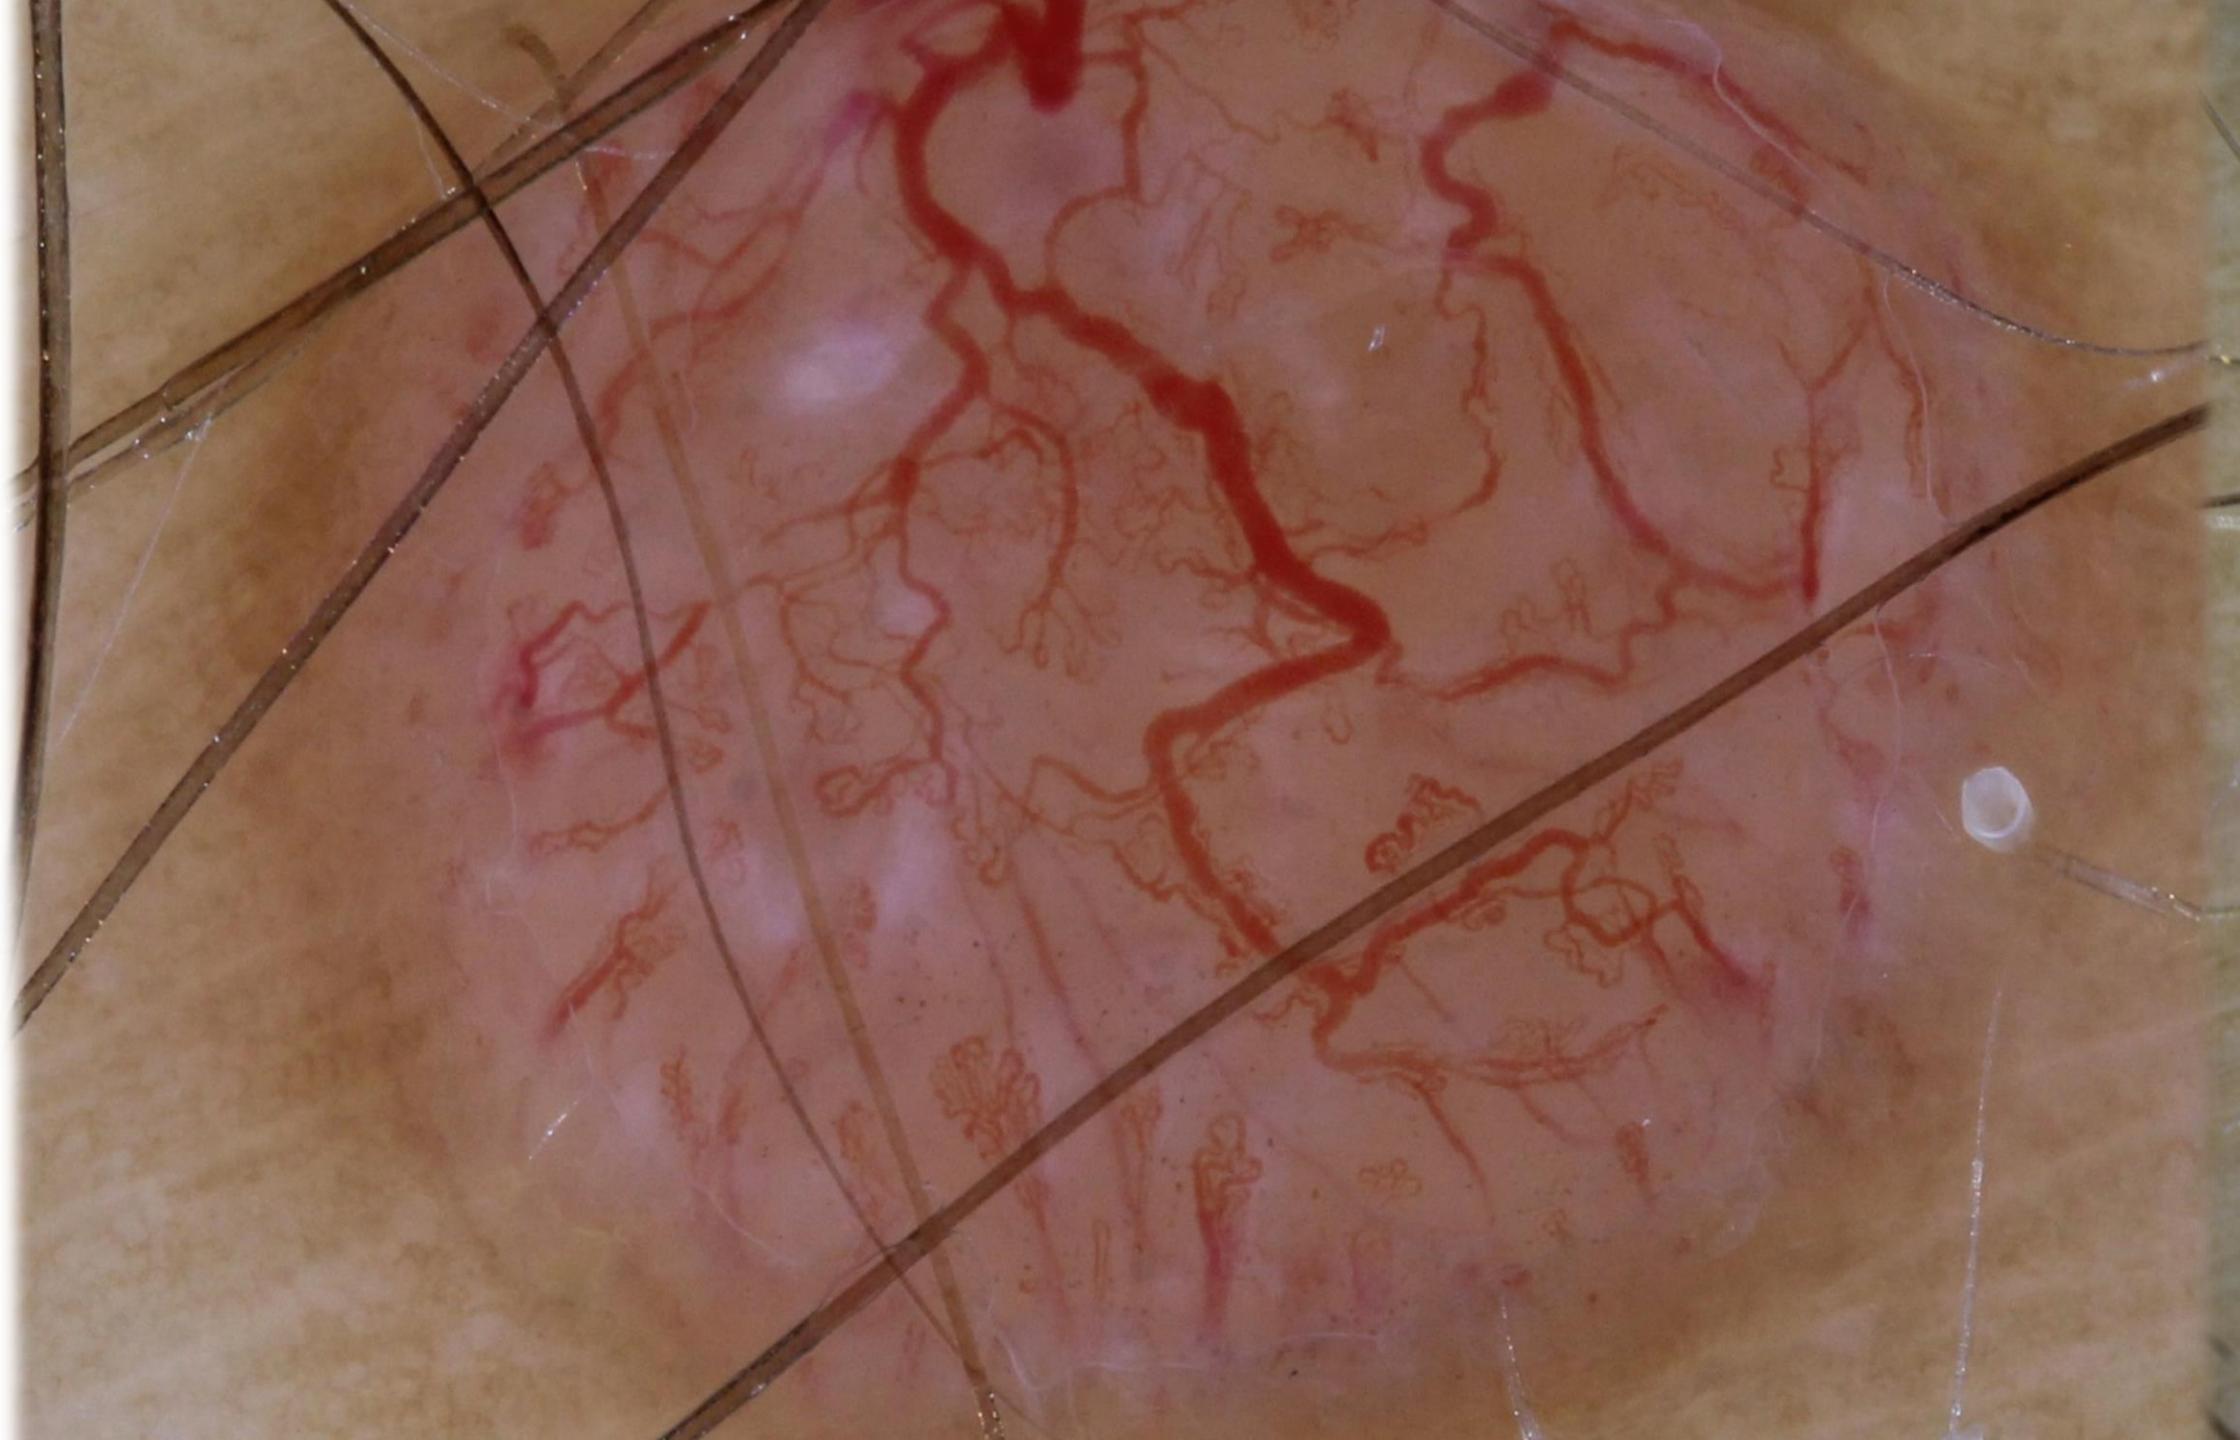

Strawberry

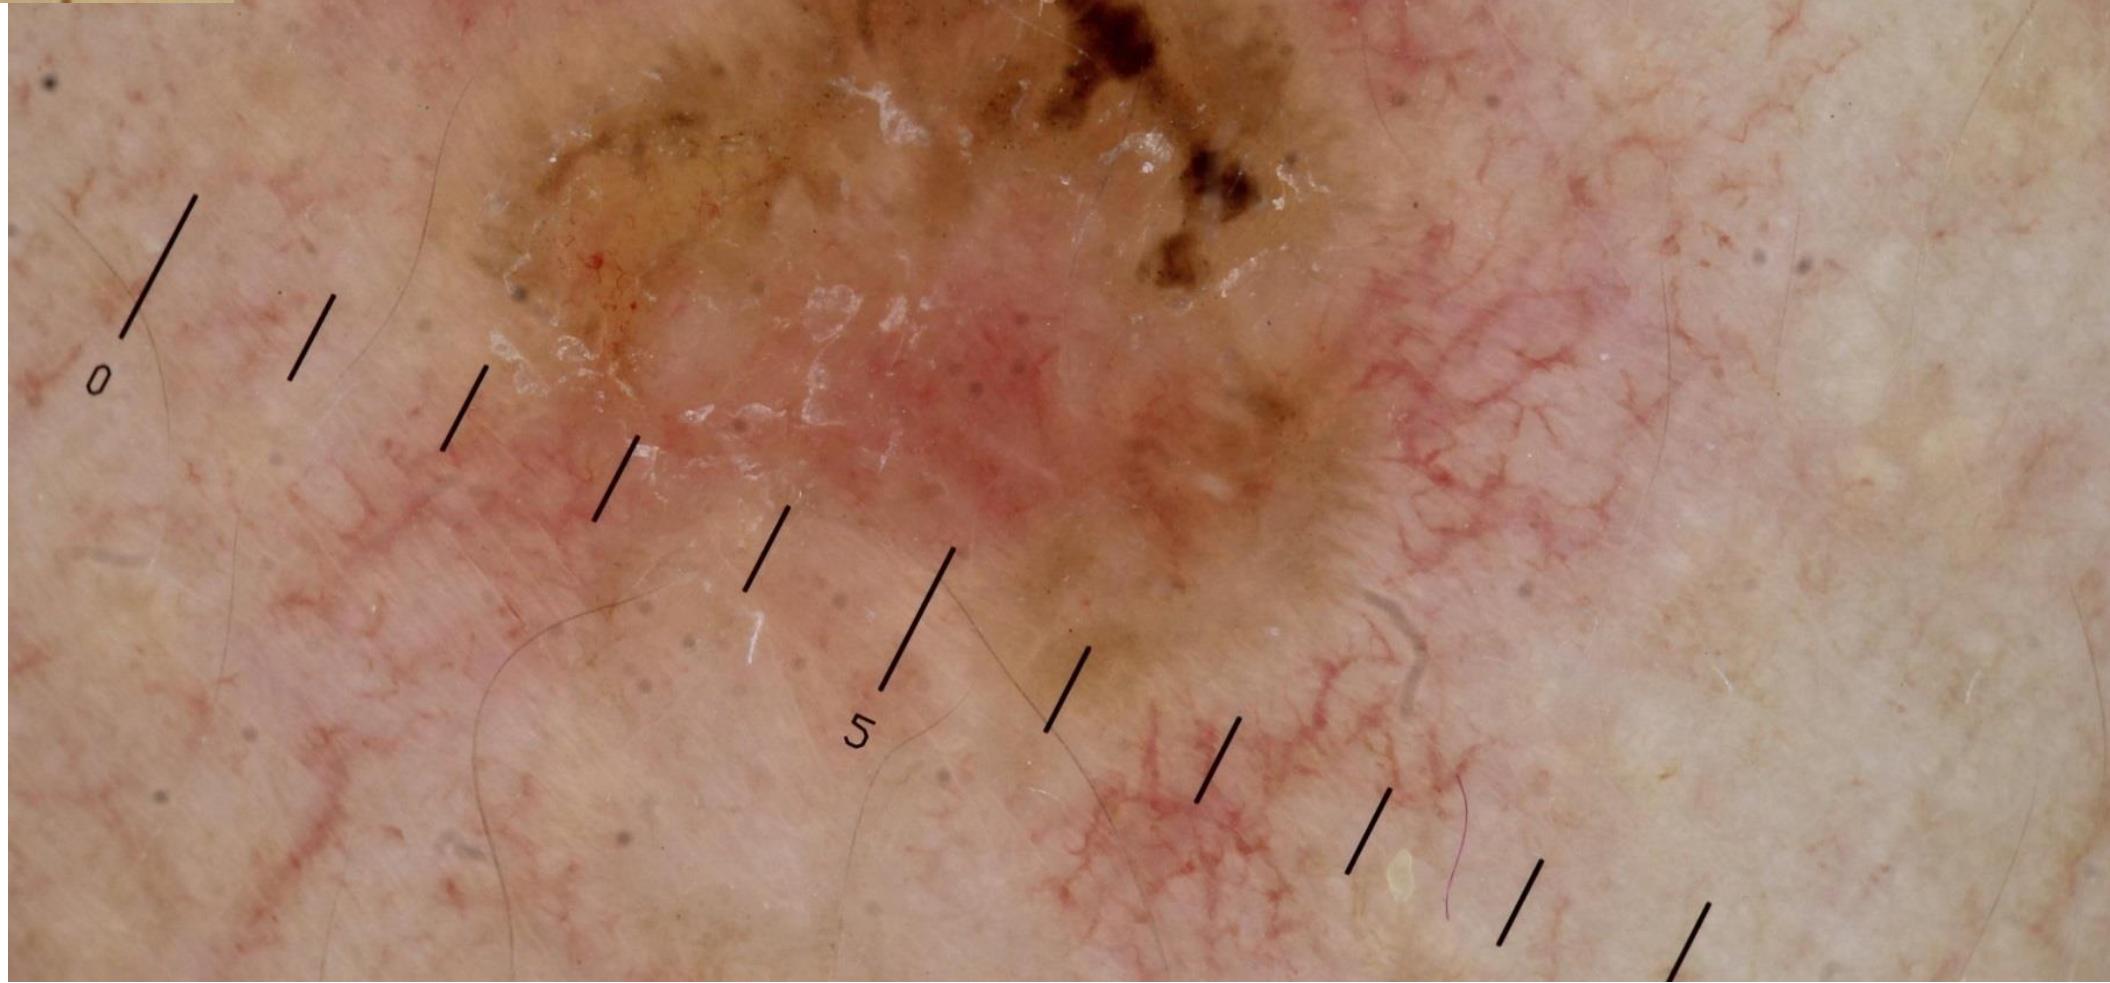

A pattern seen in facial AK, comprising a reddish pseudonetwork around hair follicles; fine, linear-wavy vessels may also surround the follicles; hair follicle openings often filled with yellowish keratotic plugs and surrounded by a white halo

Well-differentiated SCC

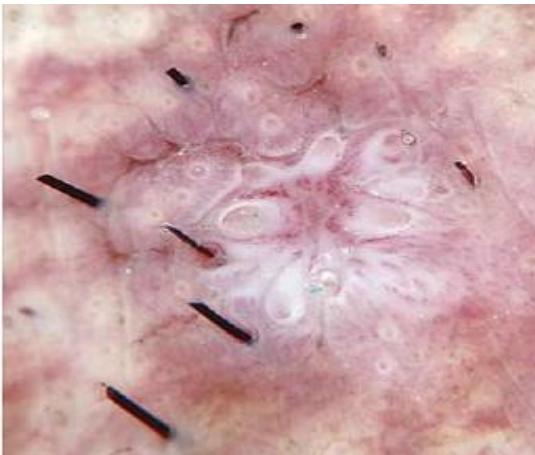

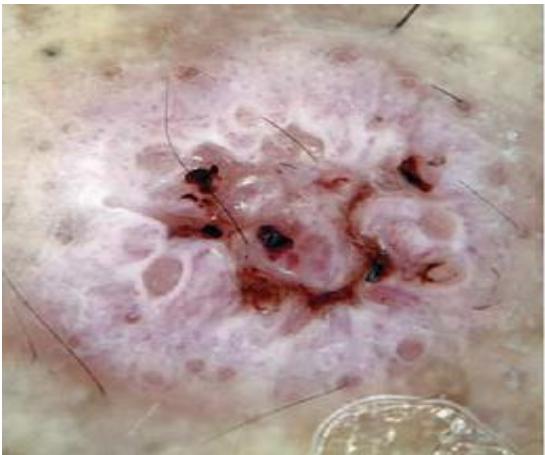

Poorly-differentiated SCC

## The clinical and dermoscopic features of invasive cutaneous squamous cell carcinoma depend on the histopathological grade of differentiation

- Well-moderately differentiated:

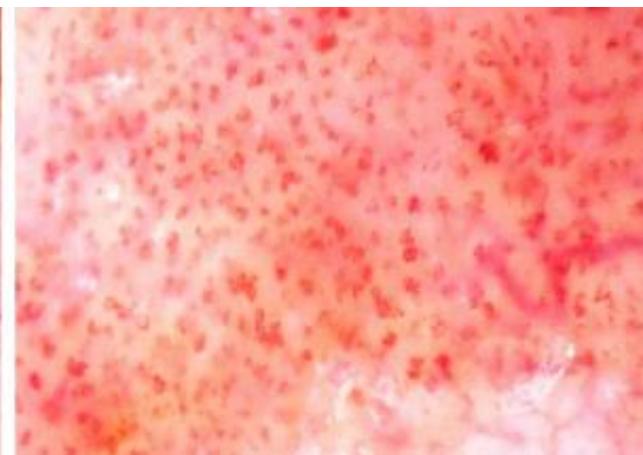

- Predominant **WHITE** color

- Scales/keratin
- White circles
- White halos
- White structureless areas

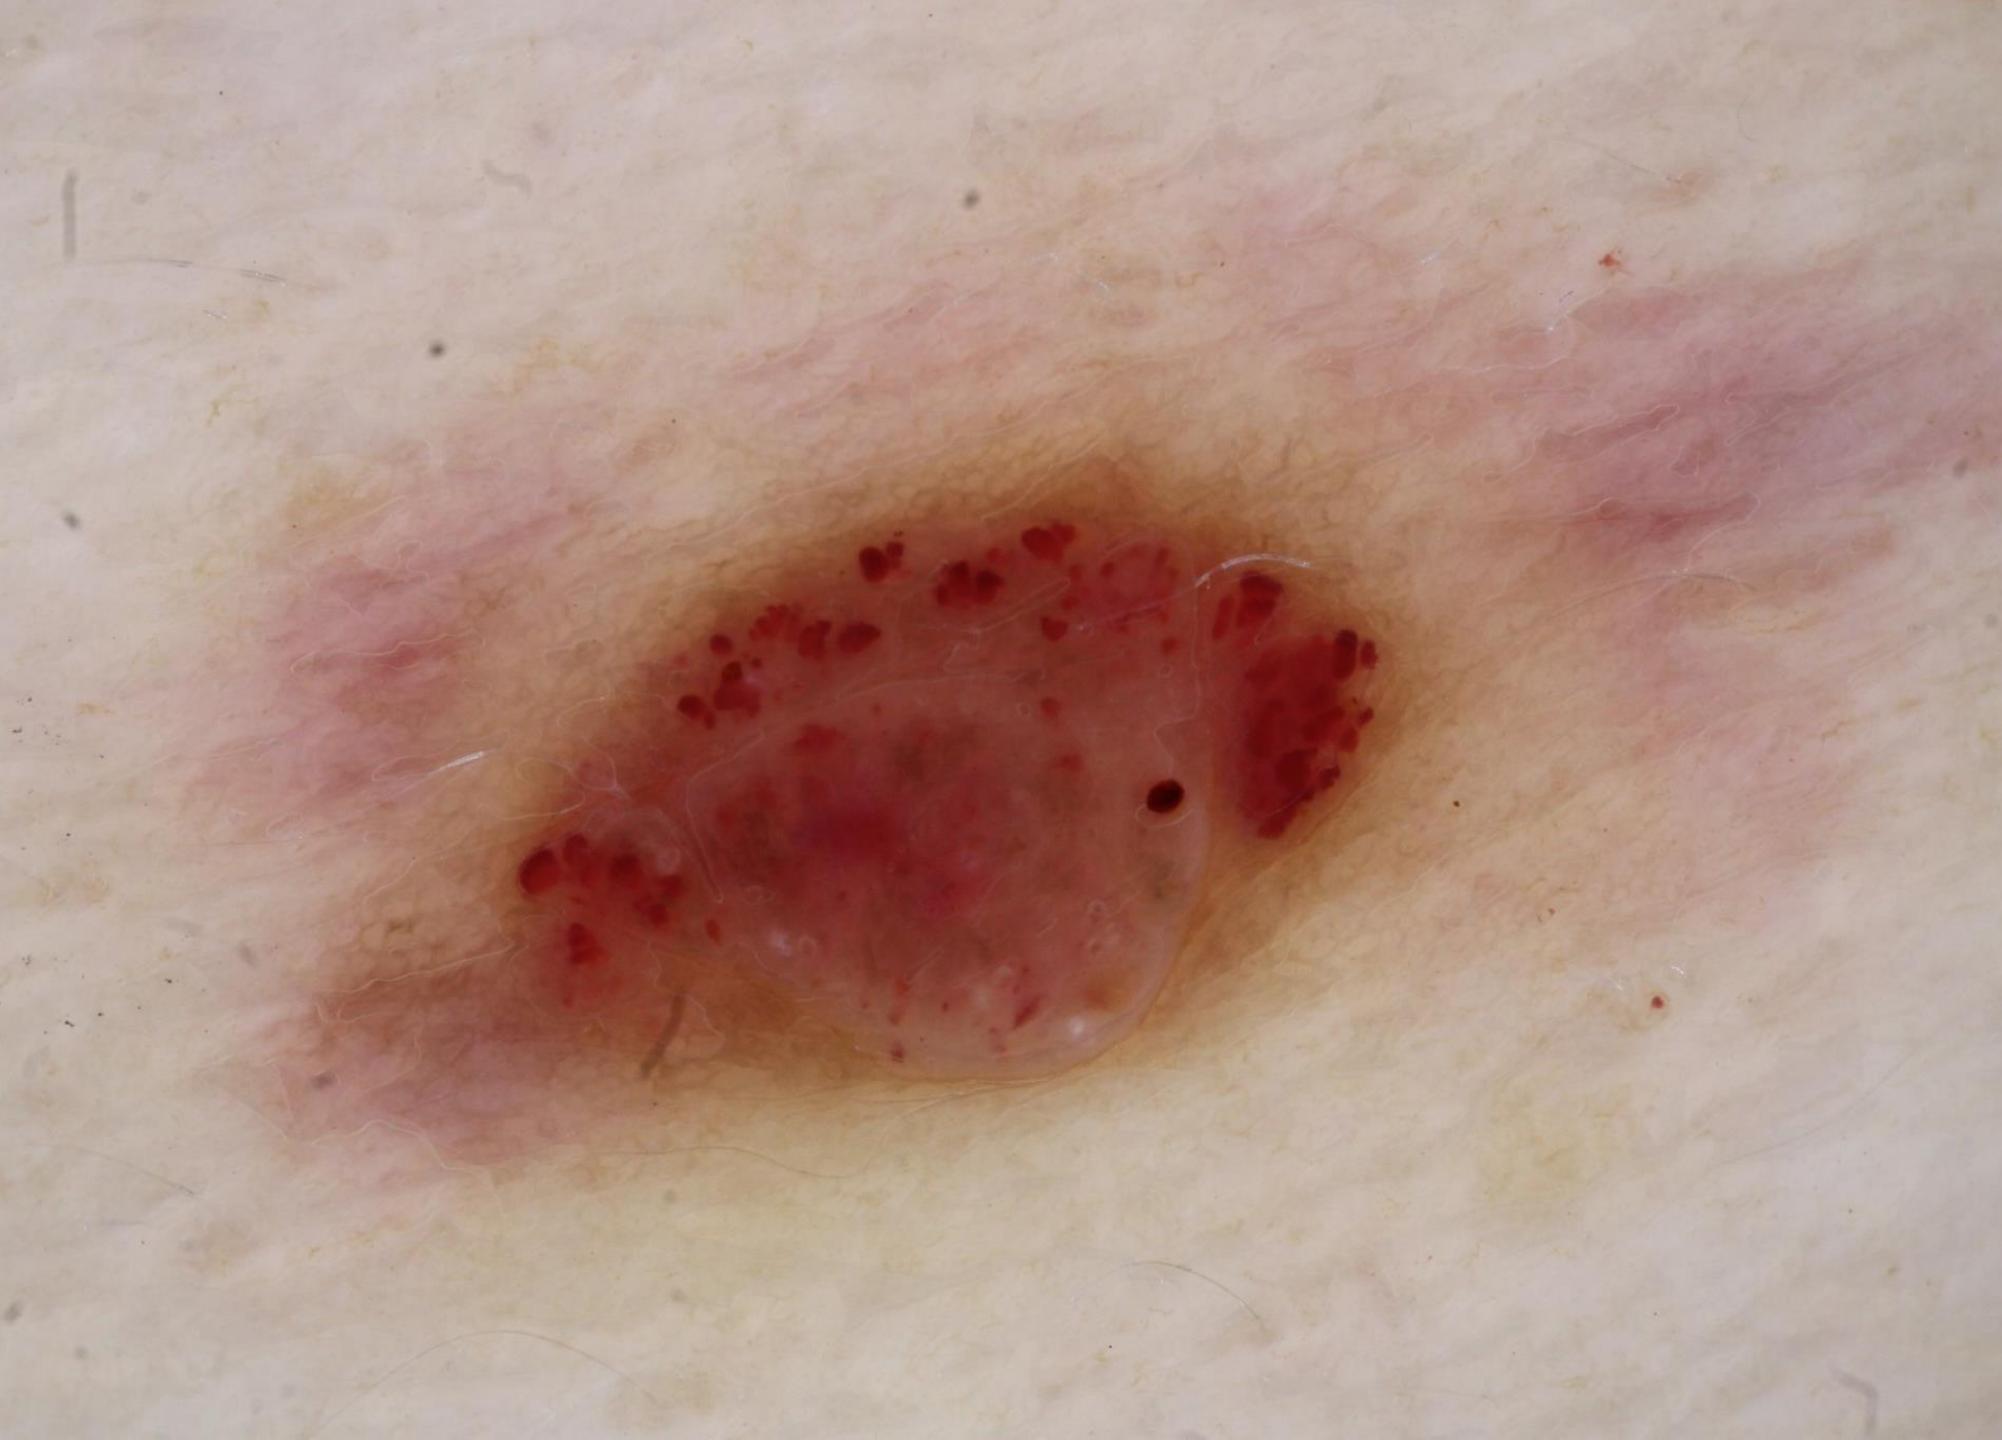

- Poorly differentiated:

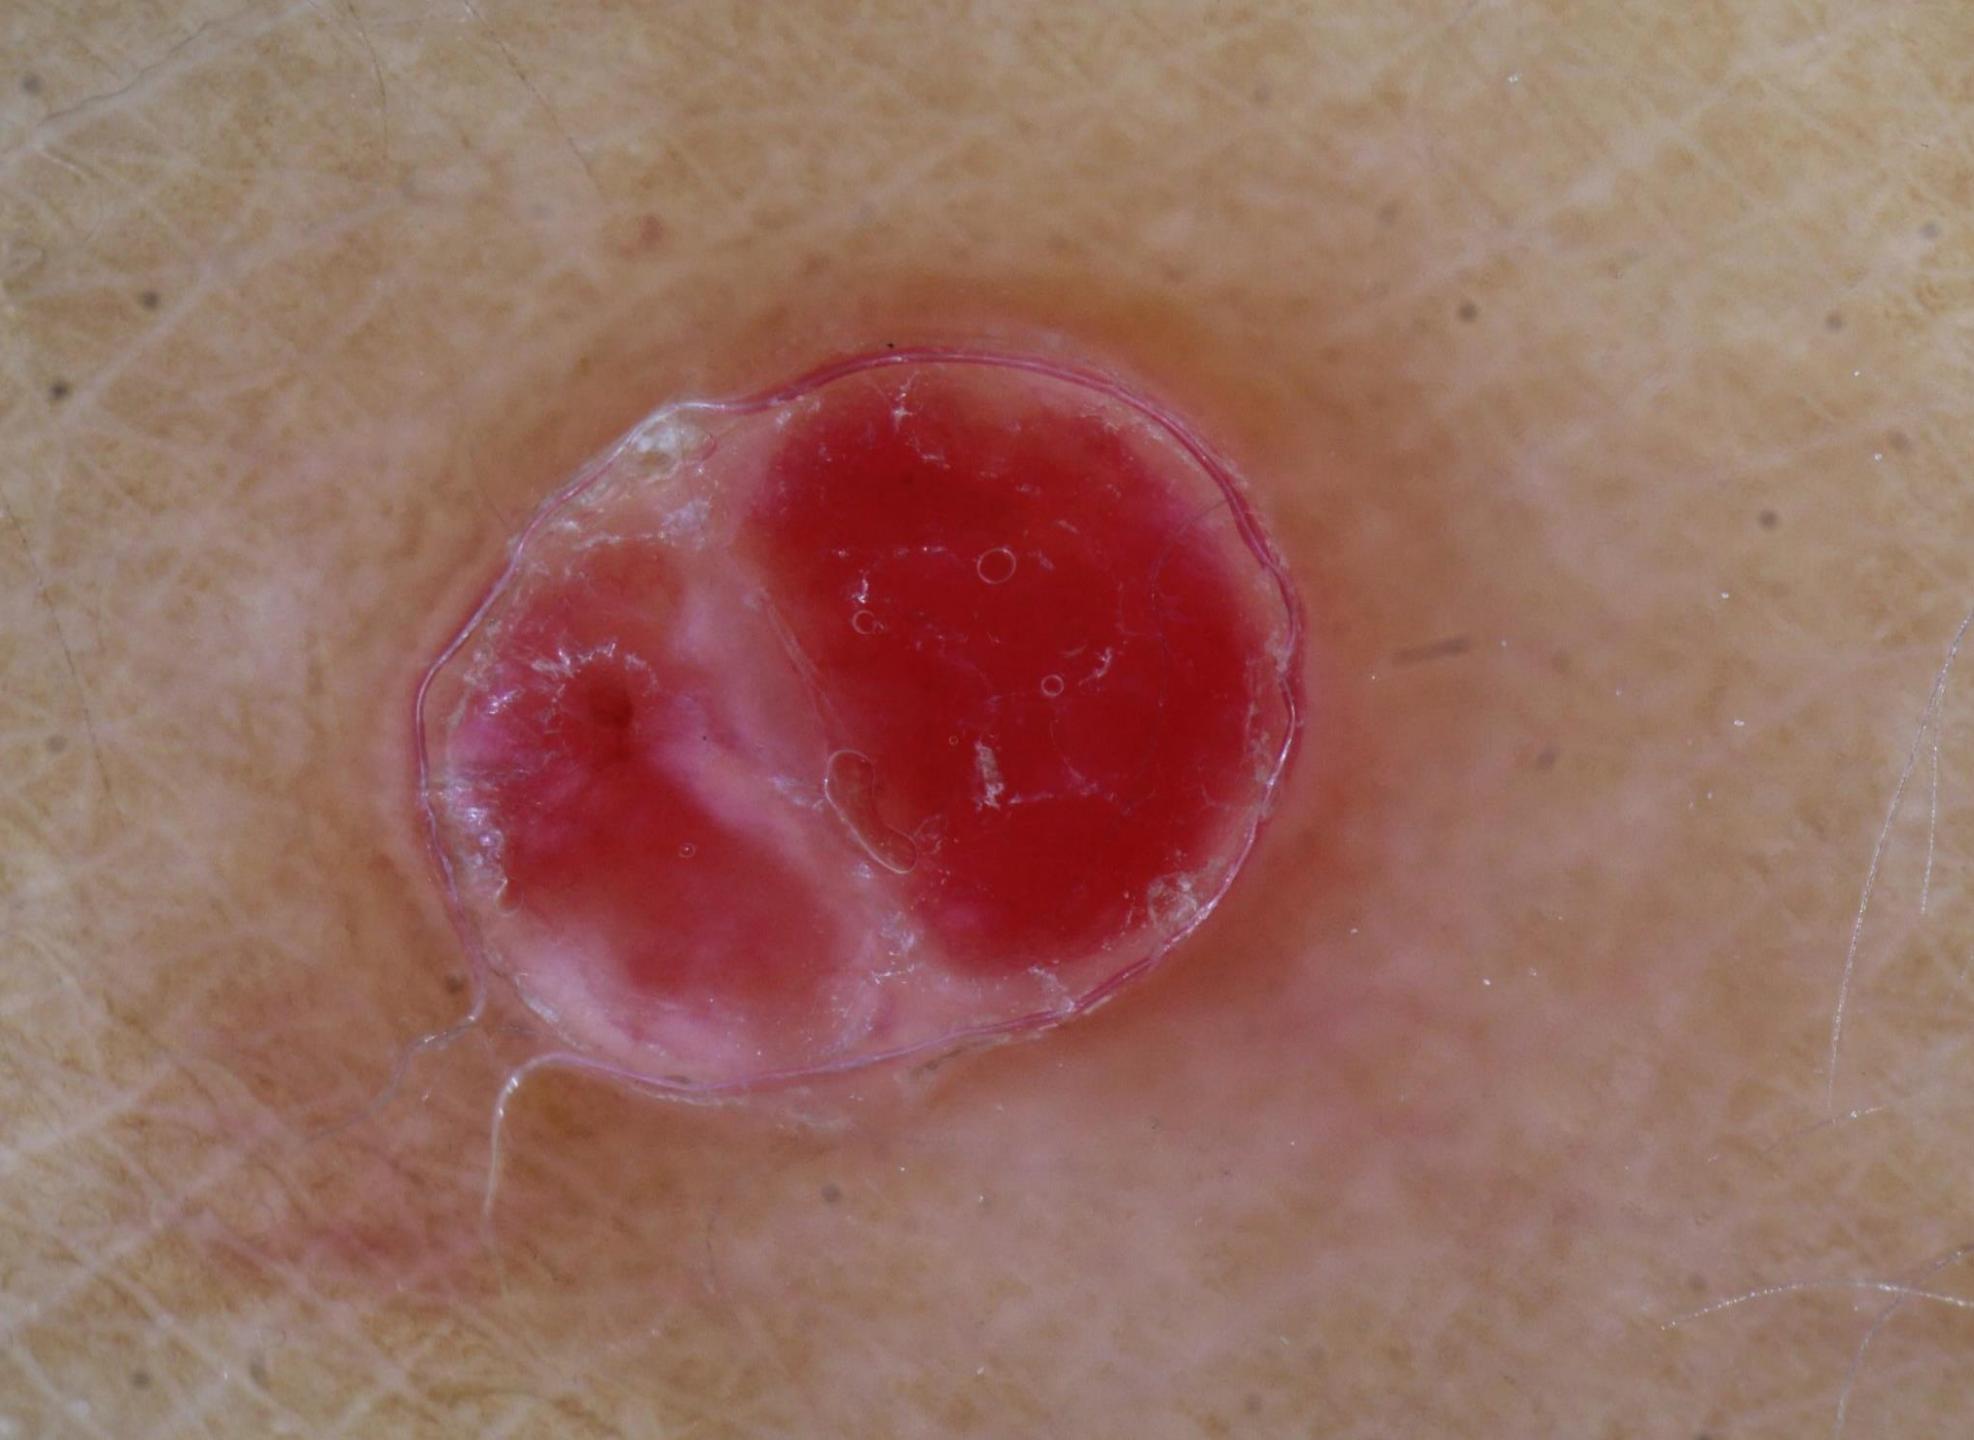

- Predominant **RED** color

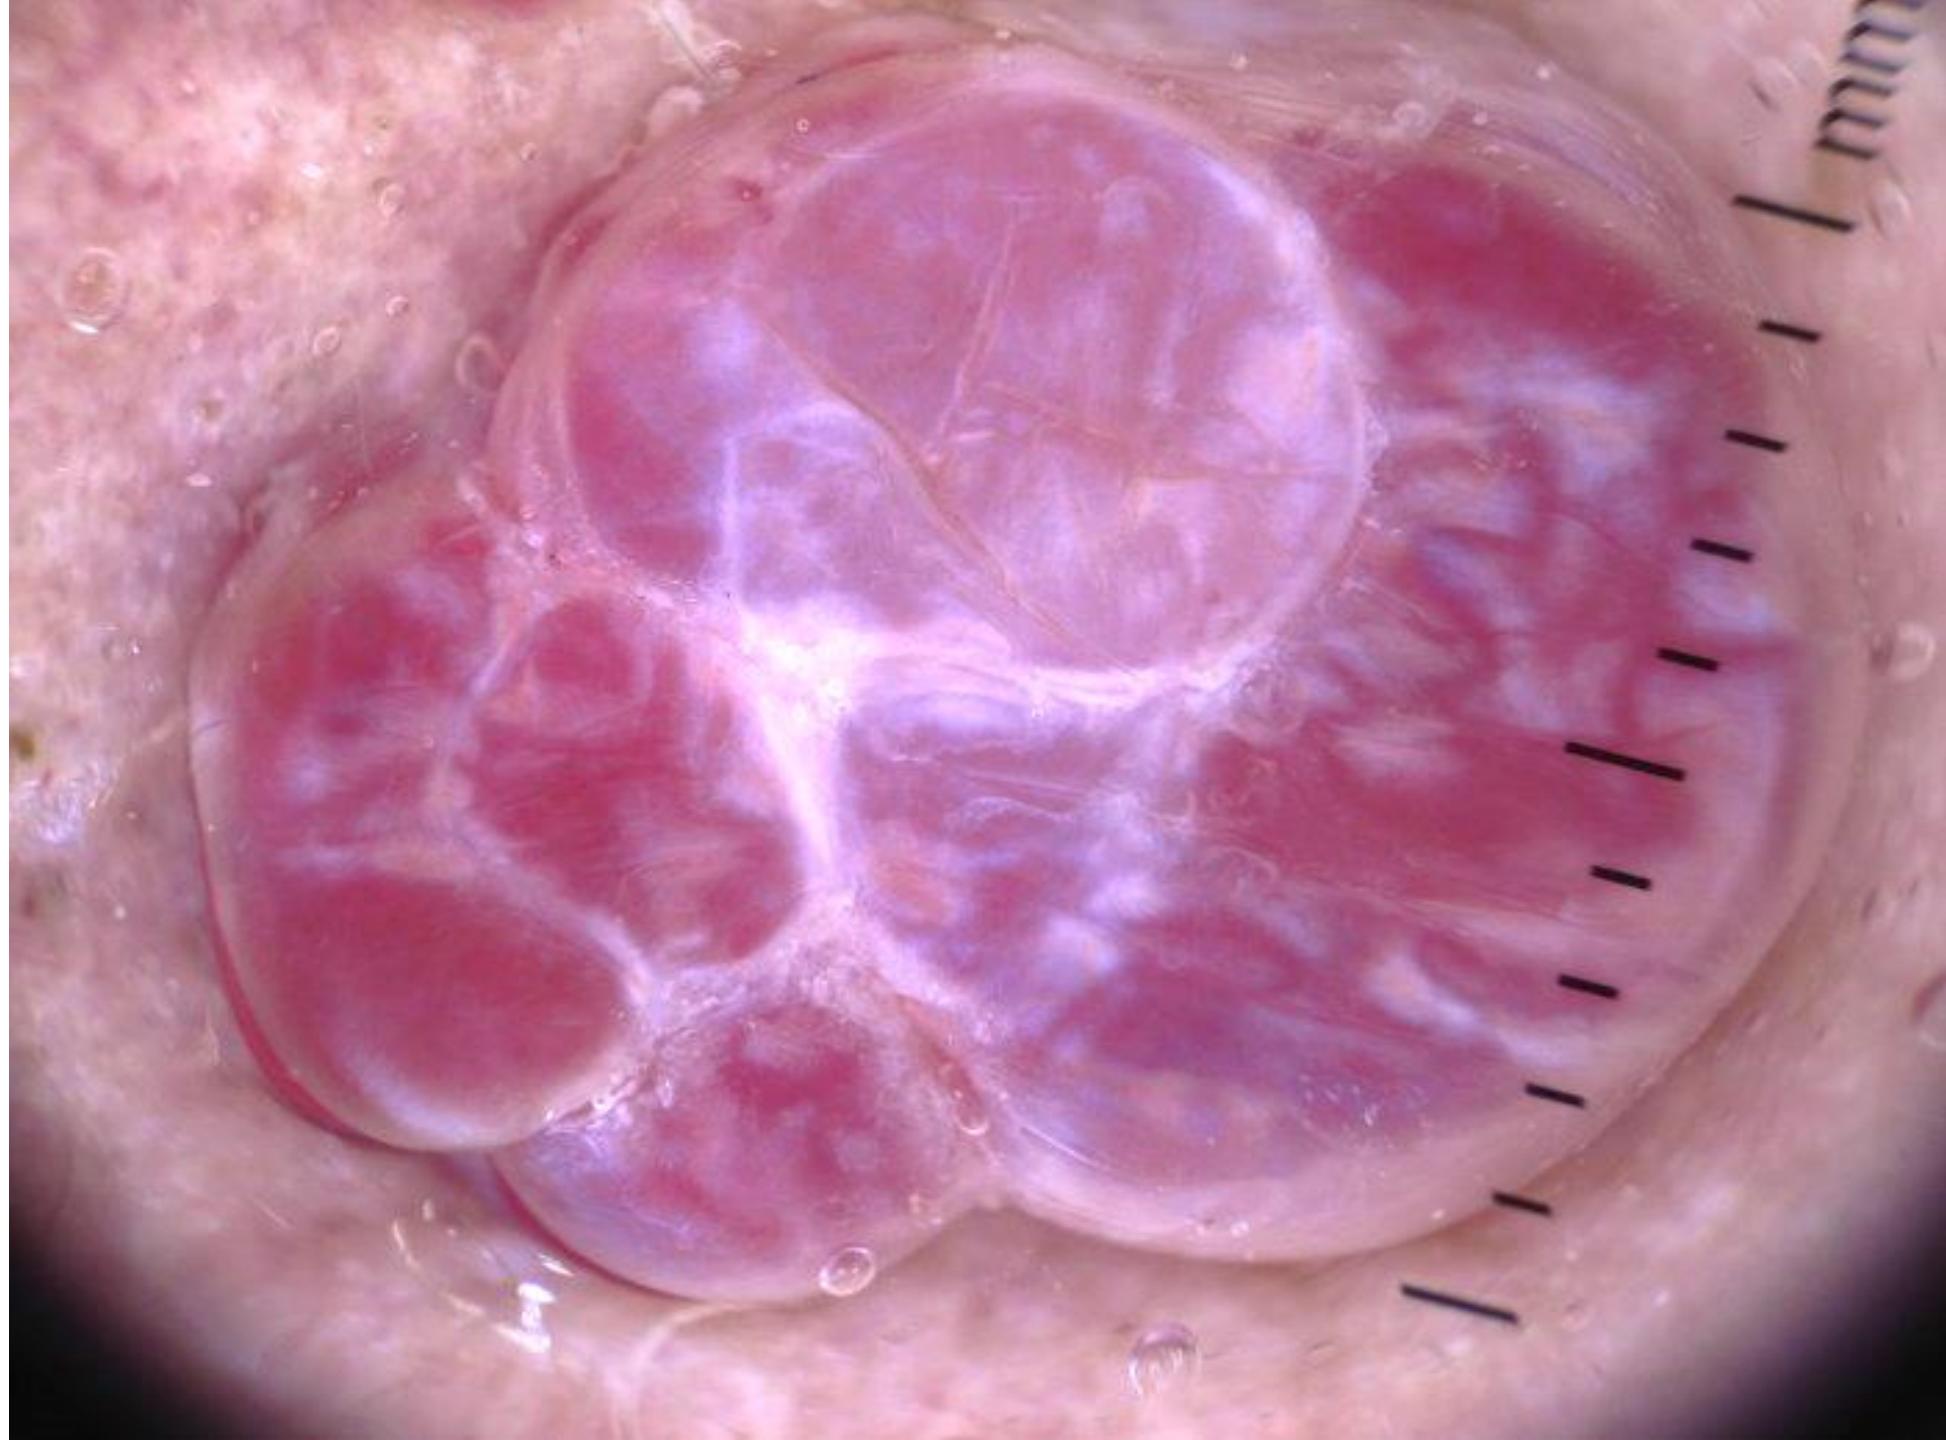

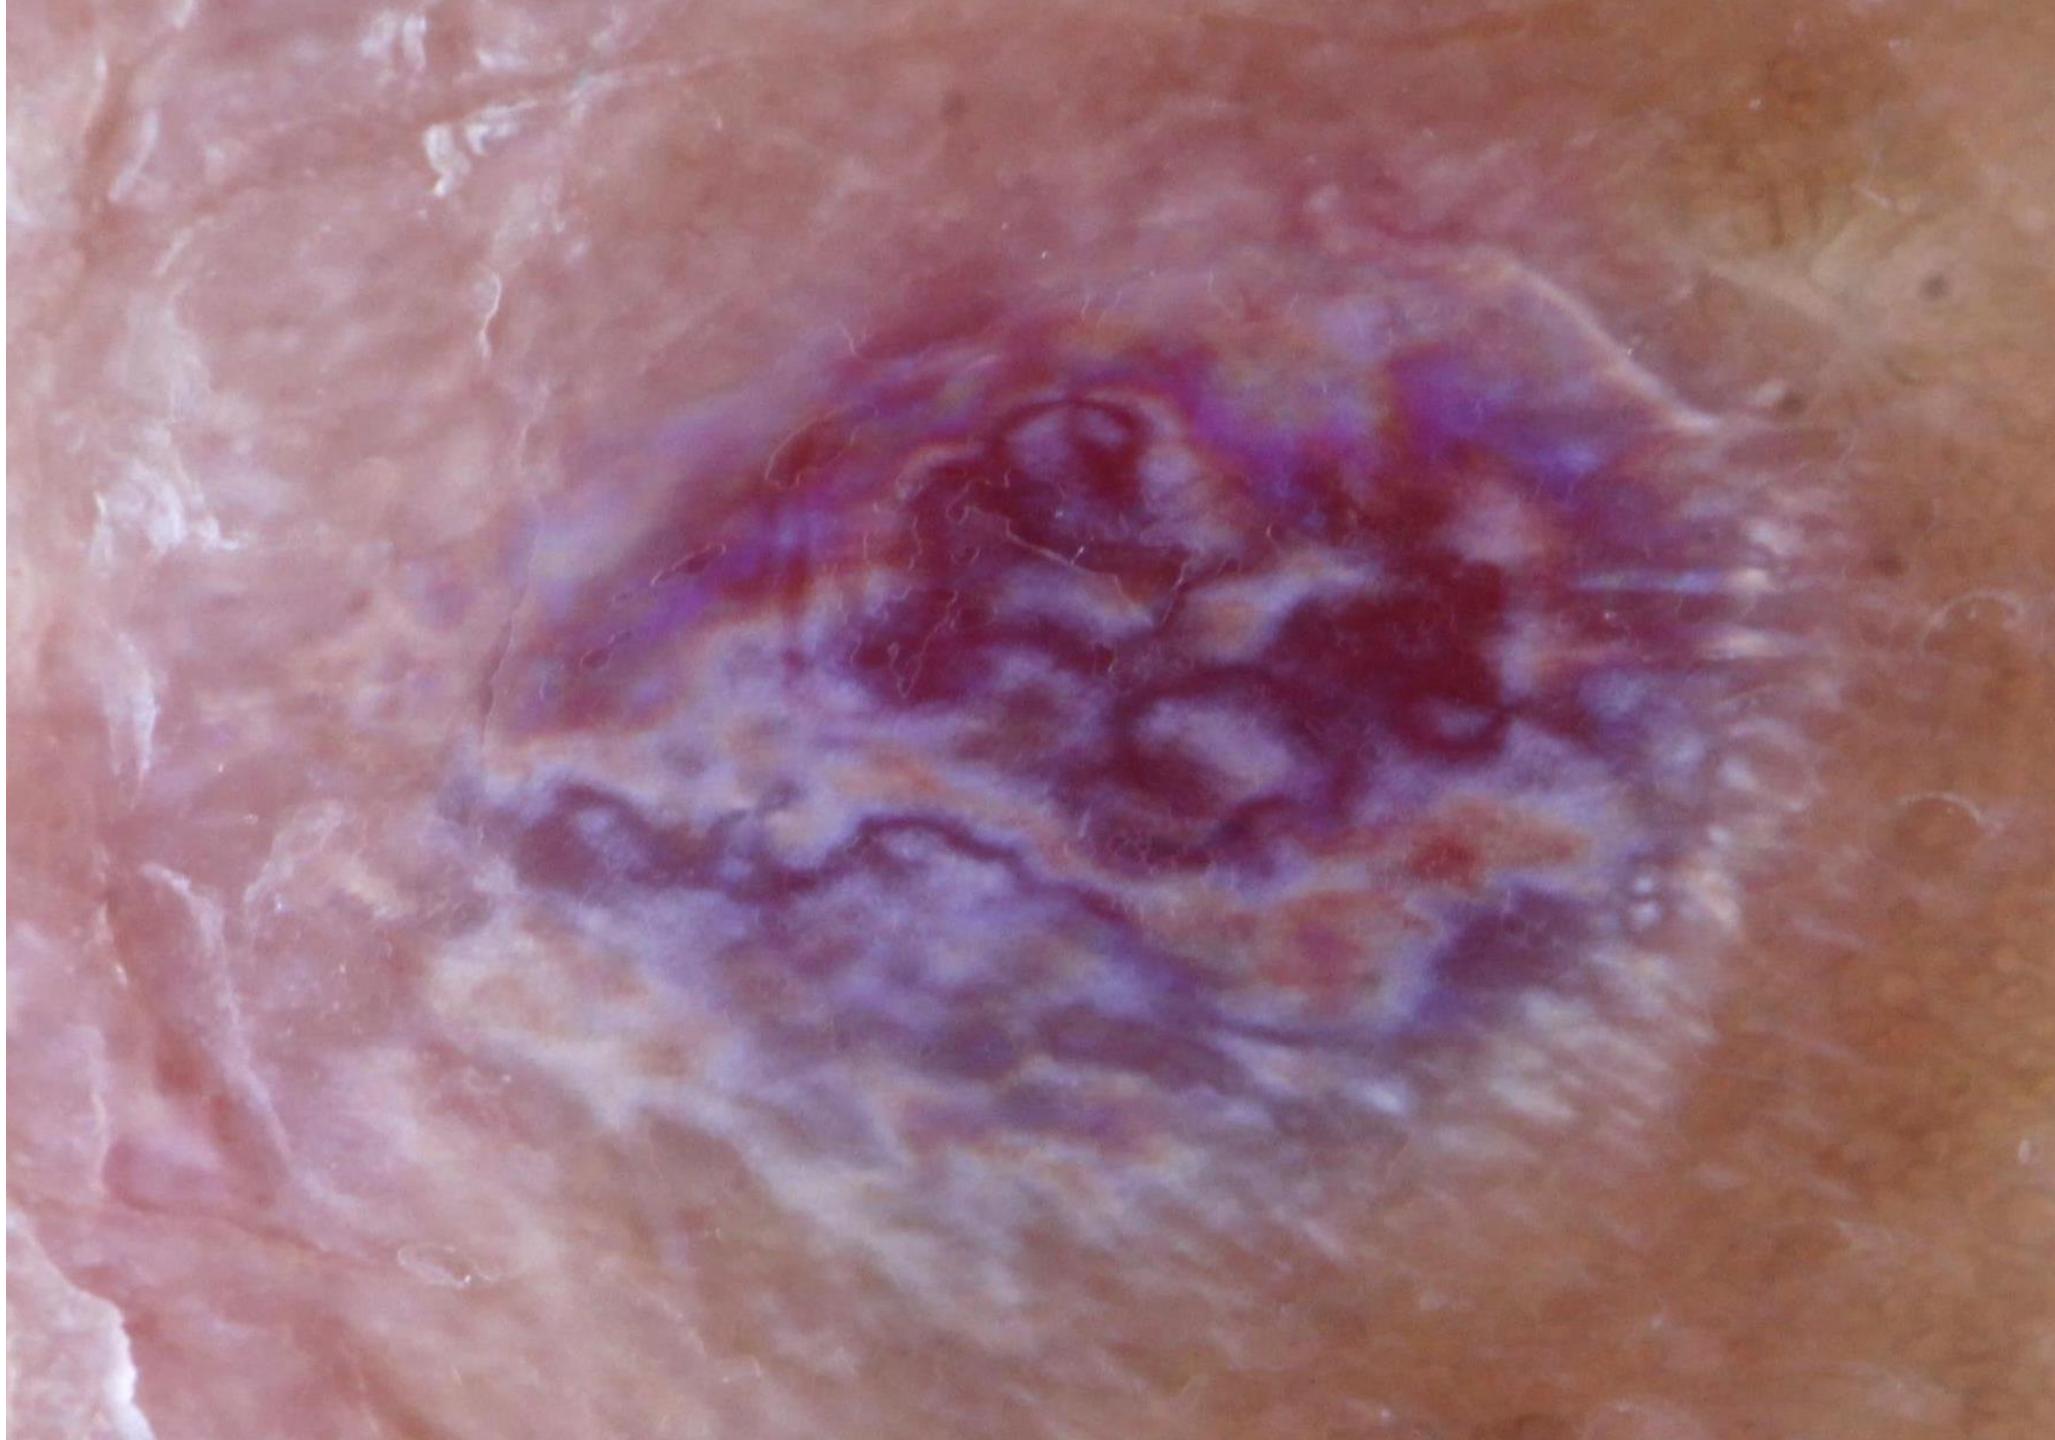

- >50% vascularity
- Vessel (diffuse distribution)
- Bleeding

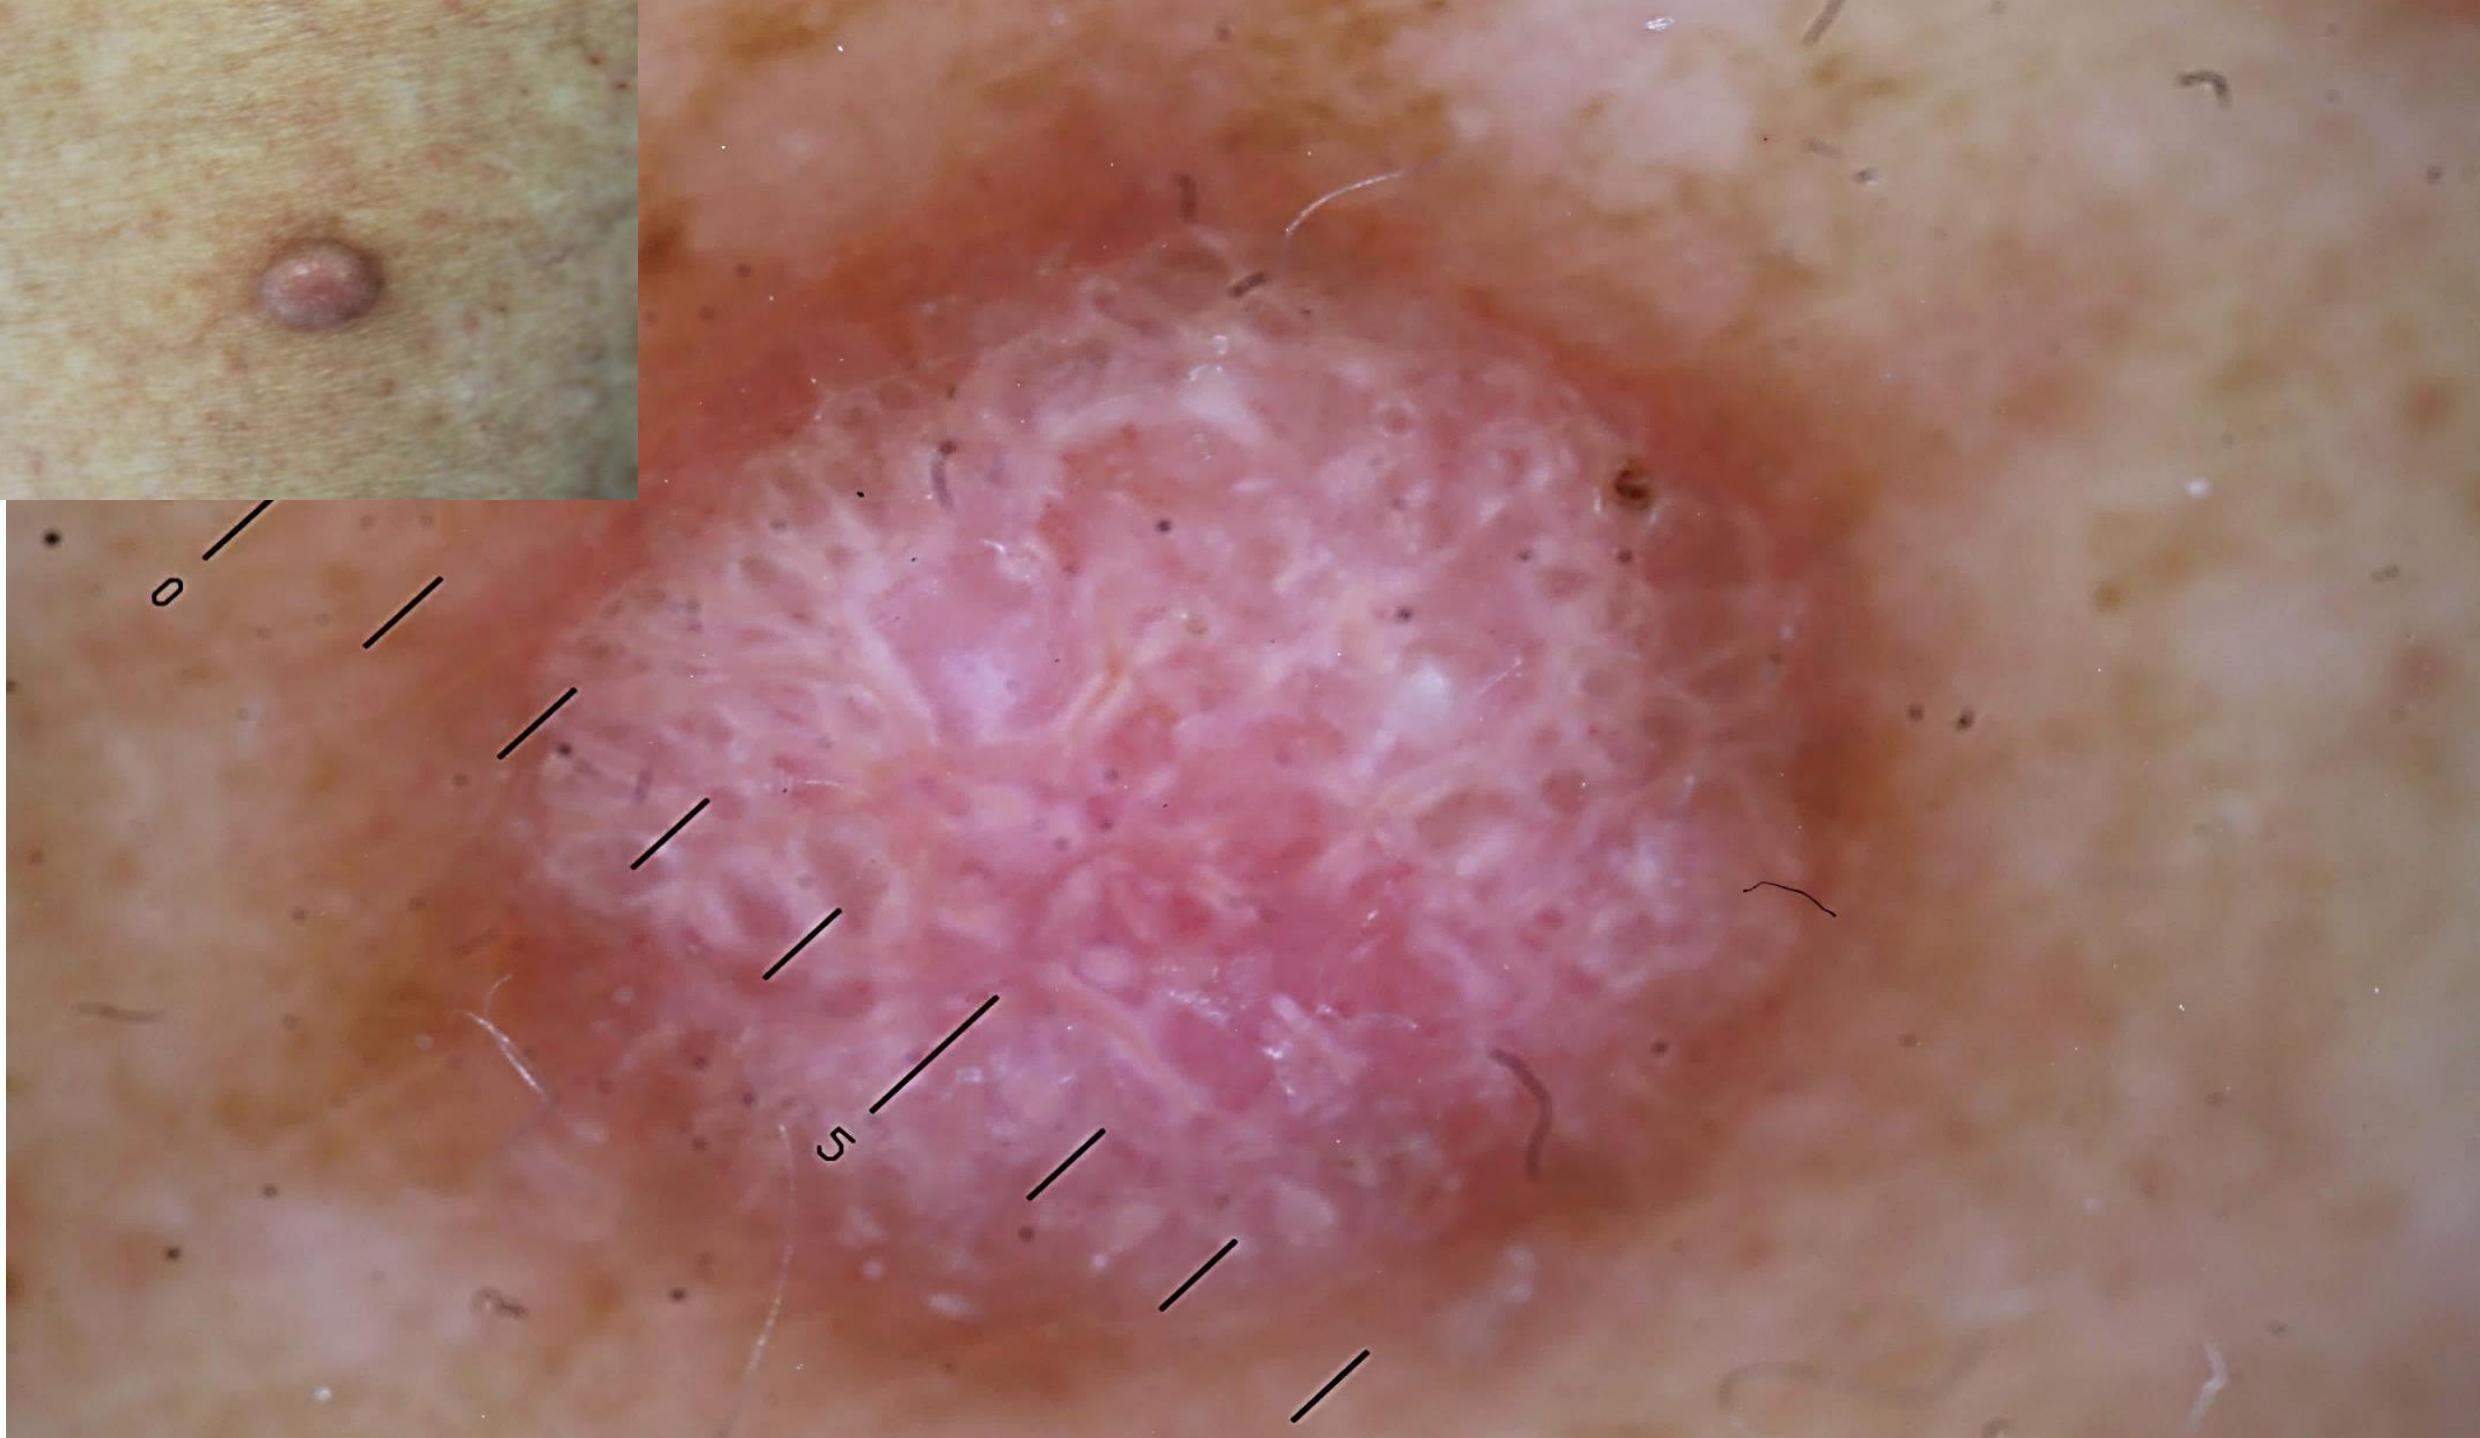

# Ulcerazione

# PREDICTION without PIGMENT

## A Decision Algorithm for Non-Pigmented Skin Malignancy

Cliff Rosendahl<sup>1</sup>, Alan Cameron<sup>1</sup>, Agata Bulinska<sup>1</sup>, Philipp Tschanzl<sup>2</sup>, Harald Kittler<sup>2</sup>

1. School of Medicine, The University of Queensland, Australia

2. Department of Dermatology and Venereology, Medical University of Vienna, Austria

The method presented here is a diagnostic tool, but no method, including this one, can be guaranteed to detect every malignancy  
In particular, any Elevated, Firm, Growing (EFG) lesion should be excised<sup>1</sup>

### Prediction without Pigment - short version

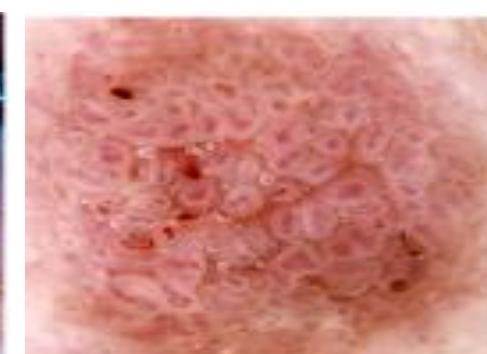

Non-pigmented  
lesion

Ulceration or white clues\* present — Consider Biopsy (exclude malignancy)

Ulceration or white clues\* not present — Apply vessel pattern analysis<sup>2</sup> (see below)

**A polymorphous pattern including dots is strongly suspicious for melanoma**  
**A clods-only pattern, and in raised lesions a centred or serpiginous pattern, should be benign.** All other patterns must be assessed for malignancy.

A clods-only pattern must have no vessels within the (red/purple) clods. A centred pattern must have vessels centred in skin-coloured clods.

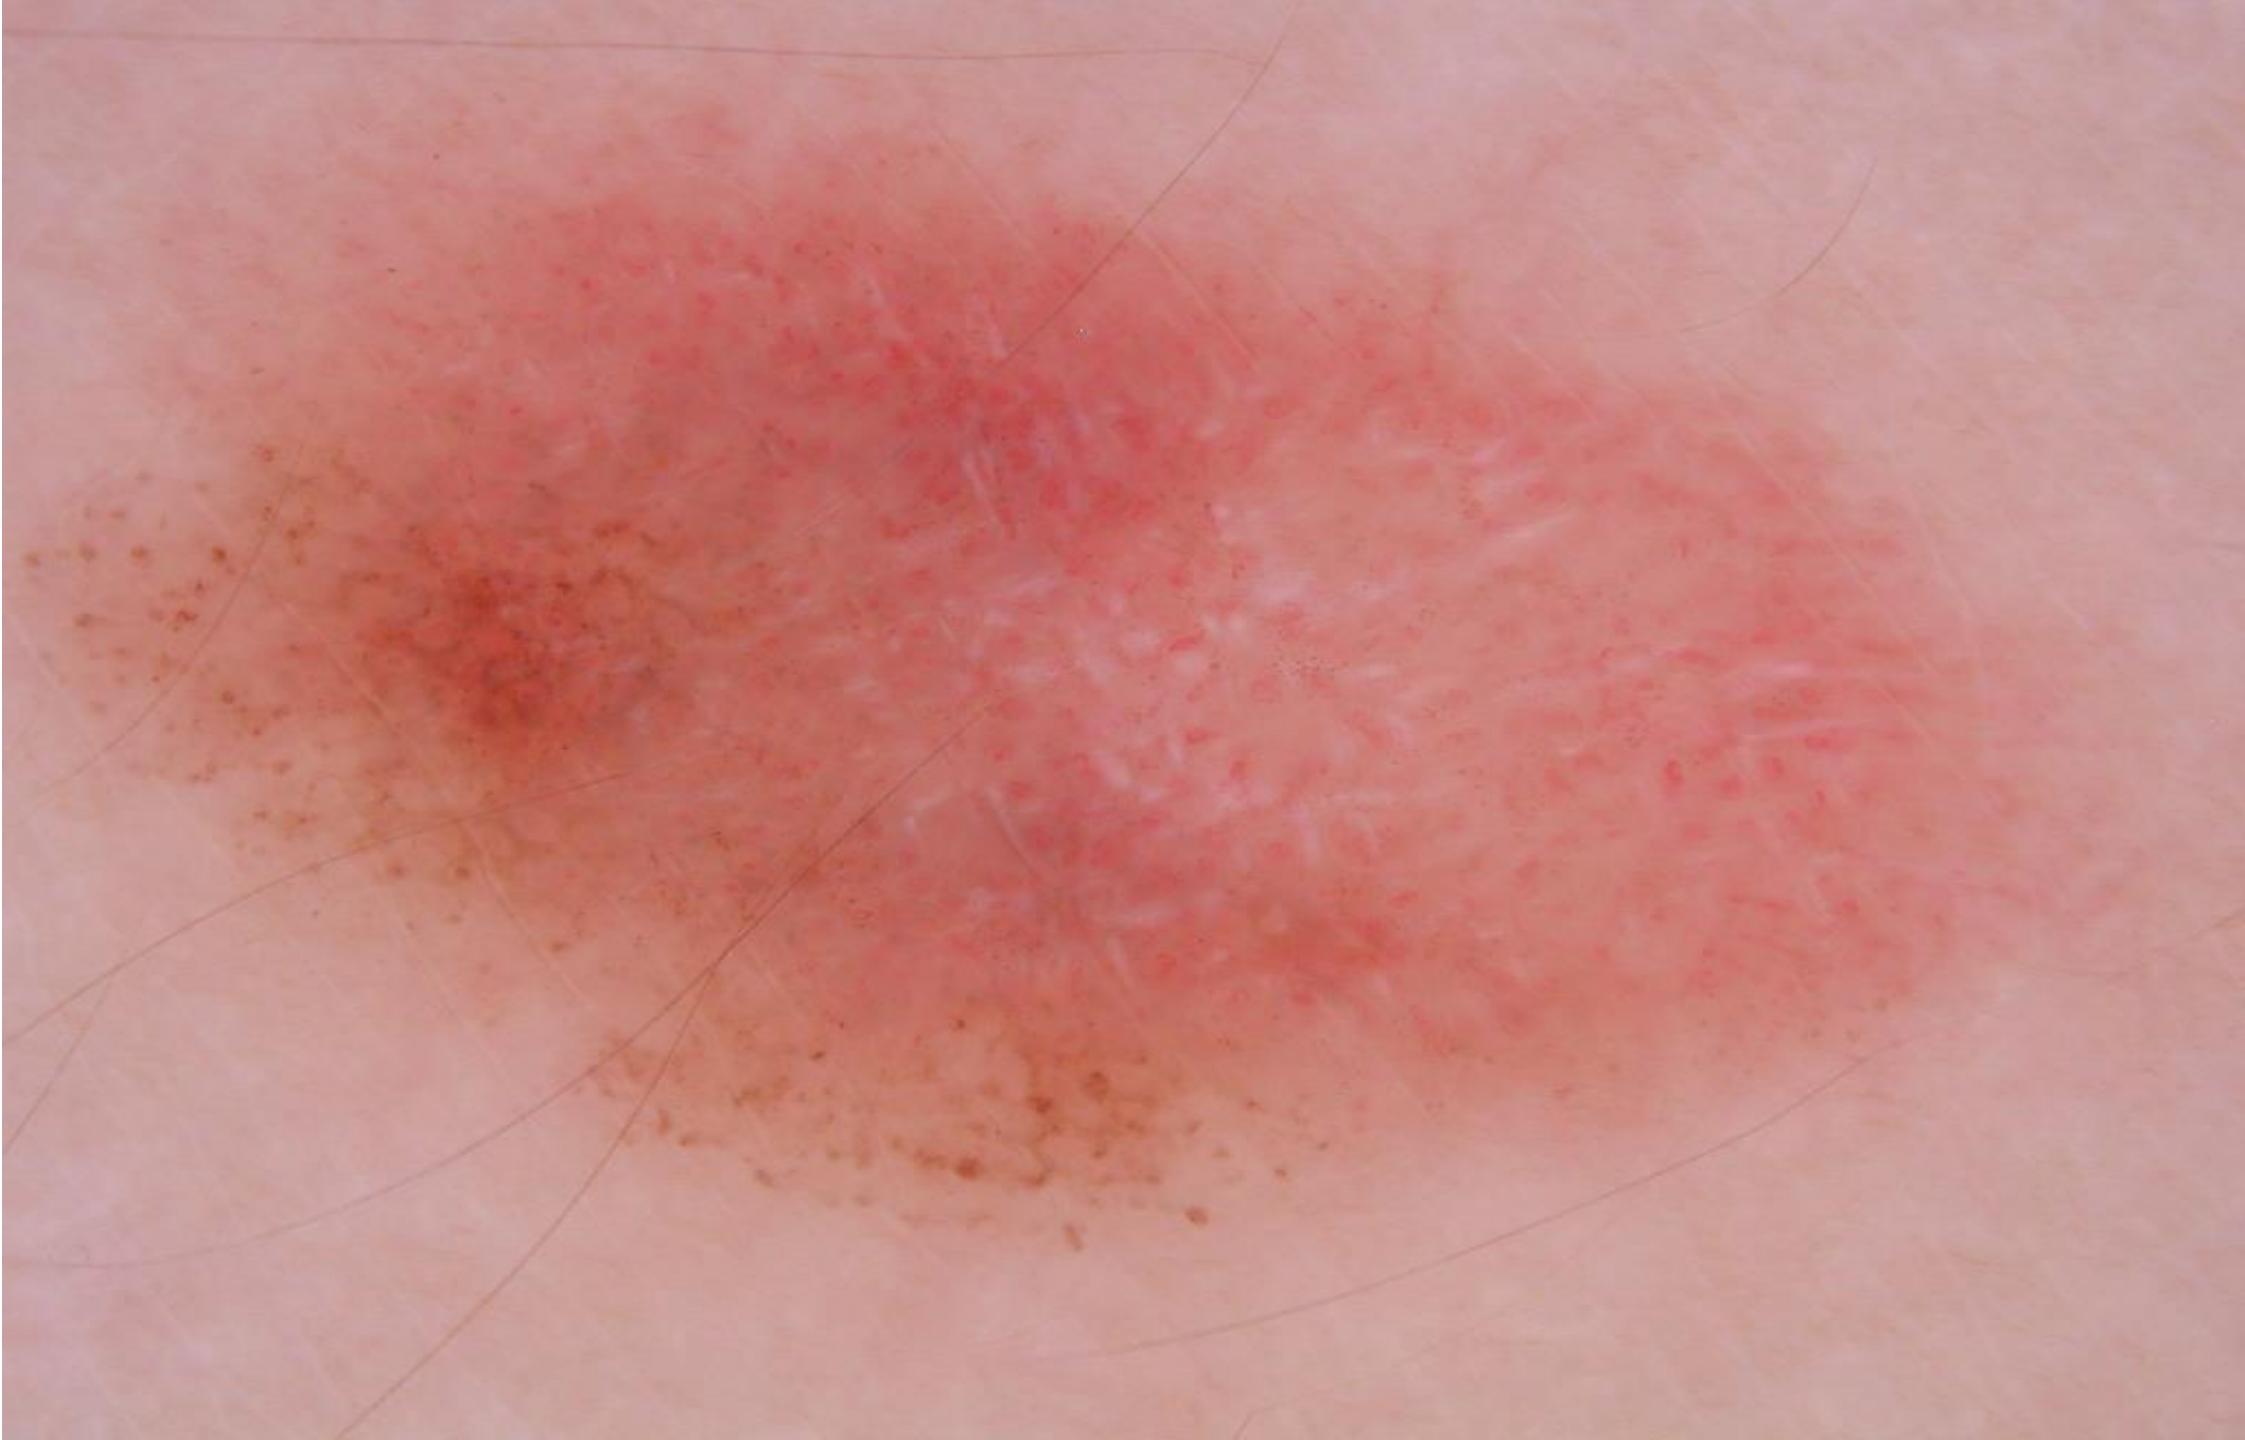

# Pink / featureless lesions

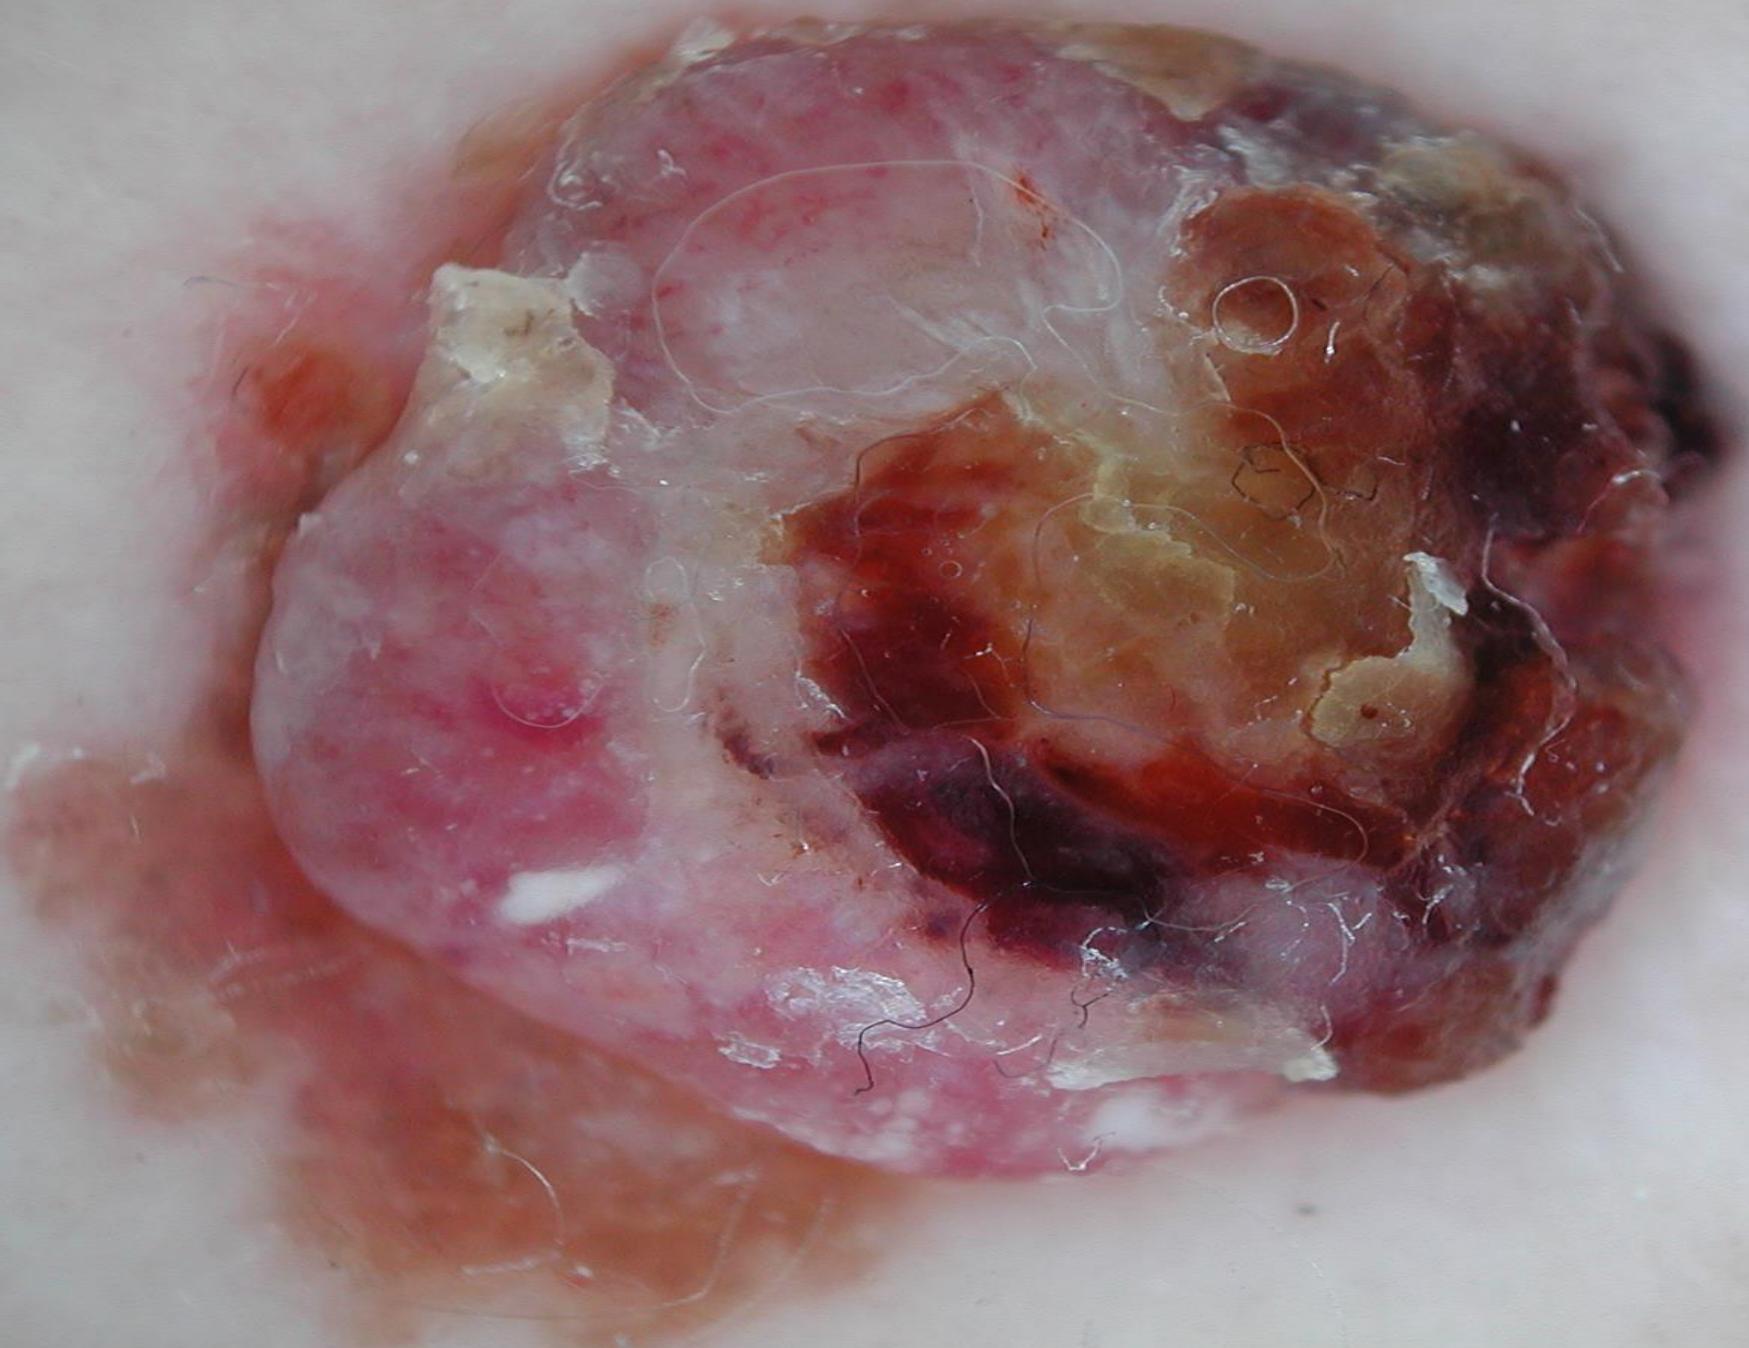

- 1. Pattern Vascolari*
- 2. Criteri per diagnosi specifiche*
- 3. Residui di pigmento*

# Pink / featureless lesions

## Nodular melanoma: five consecutive cases in a general practice with polarized and non-polarized dermatoscopy and dermatopathology

Cliff Rosendahl<sup>1</sup>, Matthew Hishon<sup>1</sup>, Alan Cameron<sup>1</sup>, Sarah Barksdale<sup>2</sup>, David Weedon<sup>2</sup>, Harald Kittler<sup>3</sup>

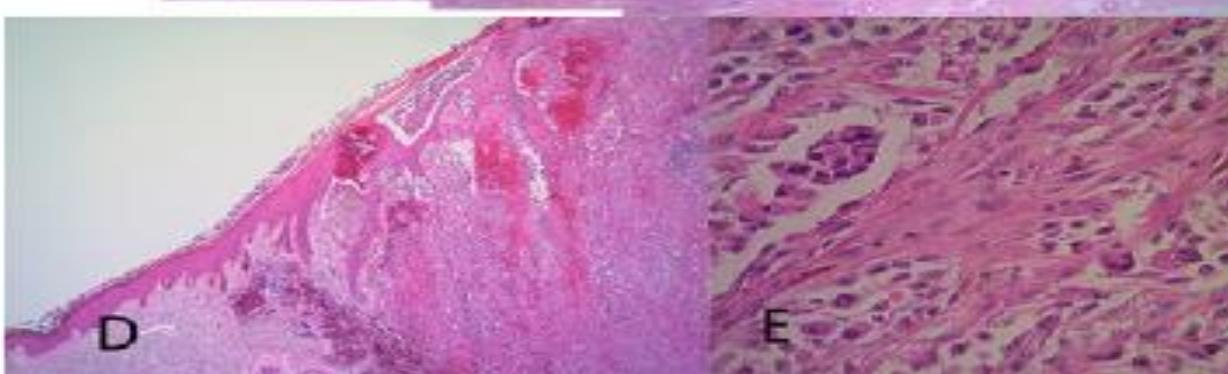

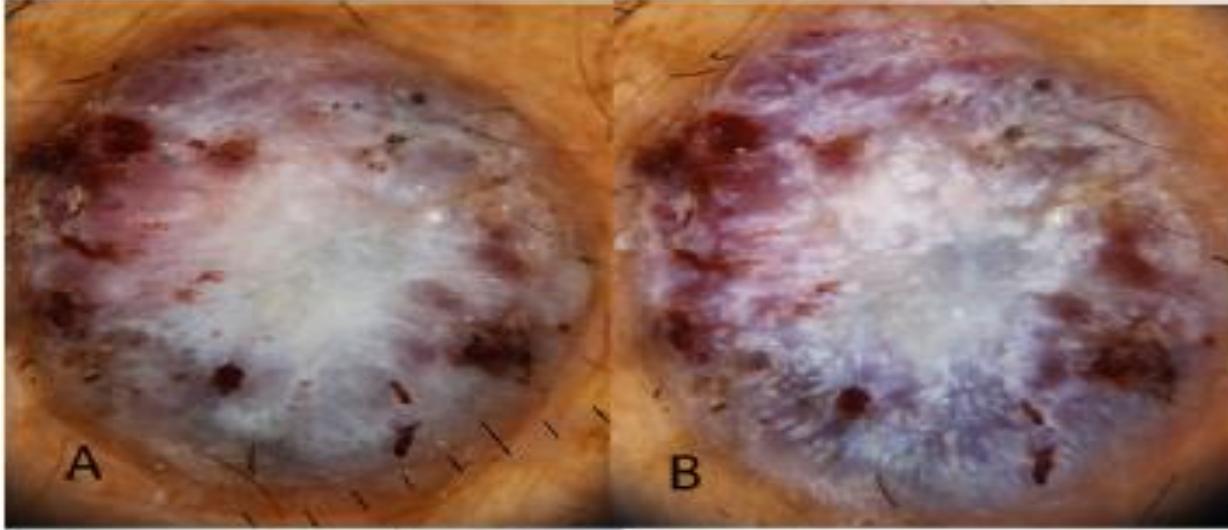

**TABLE 2.** Dermatoscopy features of the series of five consecutive nodular melanomas listed in Table 1.\*

Case	Asymmetry	Blue/Black Structures	Gray/Blue Structures	Lines white (non-polarized)	Lines white polarizing specific	Polymorphous vessels
1	yes	no	no	yes	yes	yes
2	no	yes	yes	yes	yes	yes
3	yes	no	yes	no	yes	yes
4	yes	yes	yes	no	yes	no
5	no	yes	yes	no	no	no

# Nodular melanoma: polarizing-specific white lines

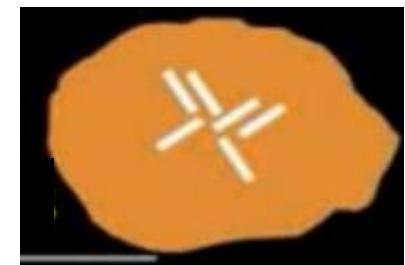

# Nodular melanoma: polarizing-specific white lines

- may be dermoscopically symmetrical
- clues to melanoma are frequently present:
  - ✓ gray/blue color
  - ✓ polarizing-specific white lines
- clue of ***polarizing-specific white lines*** should lead to excision unless a confident specific benign diagnosis (e.g. dermatofibroma) can be made on historic and clinical grounds

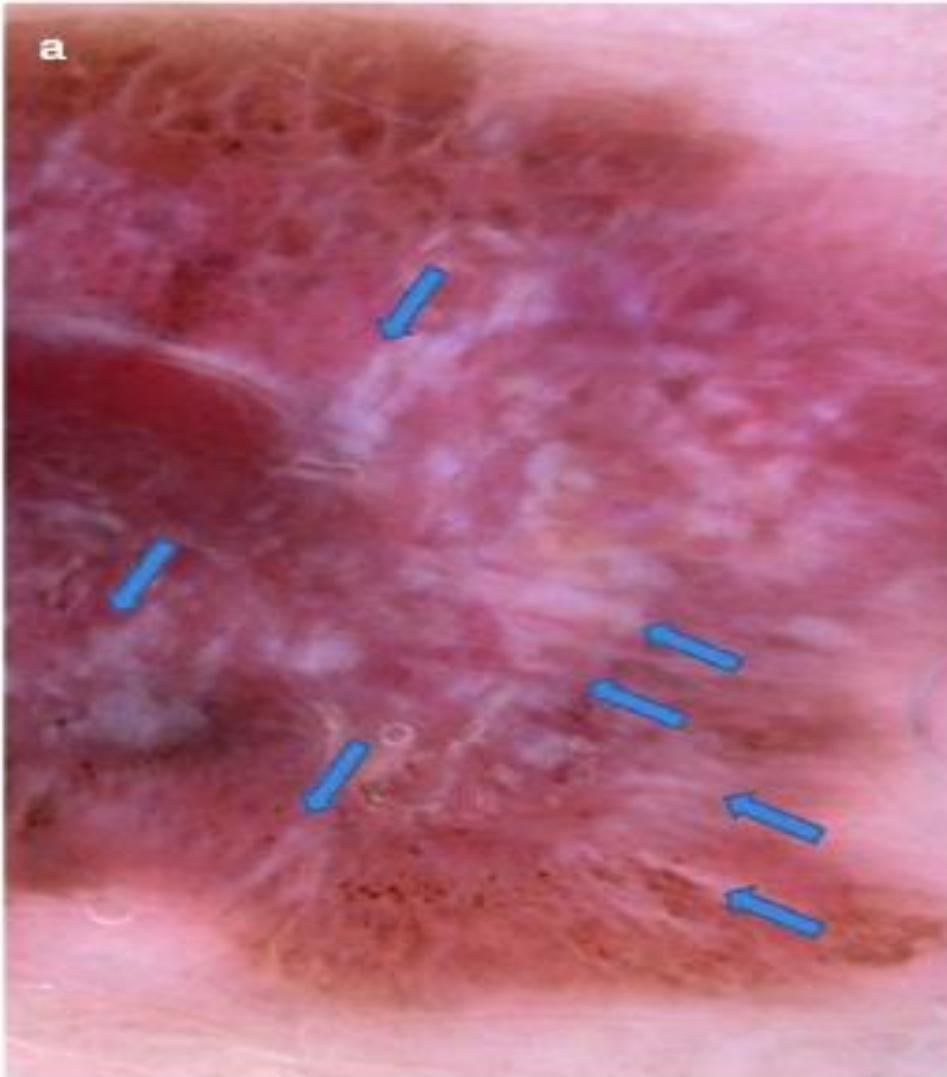

# Shiny-white streaks: definizione

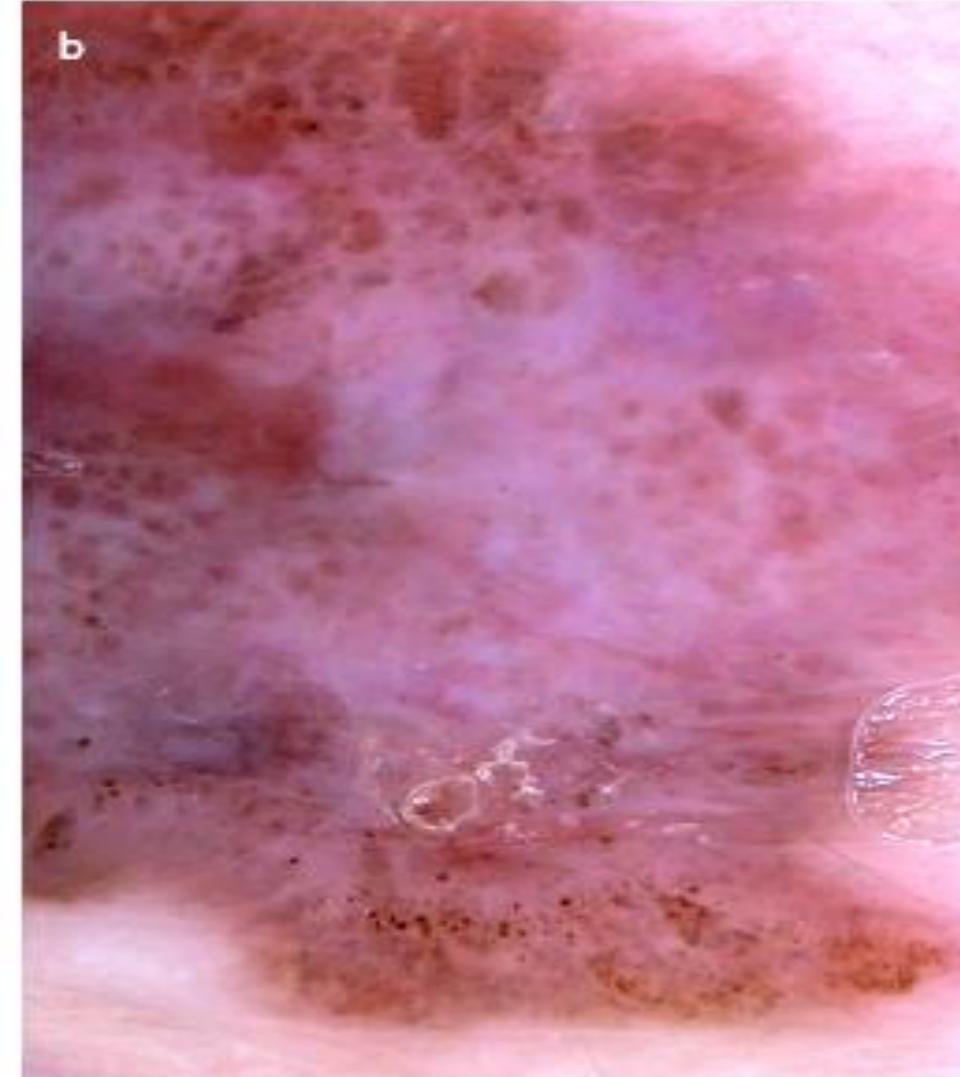

- “*Shiny-white areas which often have a stellate or streak-like appearance*” (Benvenuto-Andrade, 2007)
- “*shiny, bright white, linear streaks*
- *often oriented parallel to each other or in an orthogonal fashion*”
- have been also termed “*chrysalis structures*” (Marghoob, 2009)

→ Shiny-white streaks ←

Dermoscopia  
a luce polarizzata

Dermoscopia  
a luce non polarizzata

Di Stefani A. et al. *Australas J Dermatol* 2010;51:295-8.

# “Crisalide” è un termine improprio!

- Stadio di pupa (o crisalide) della farfalla

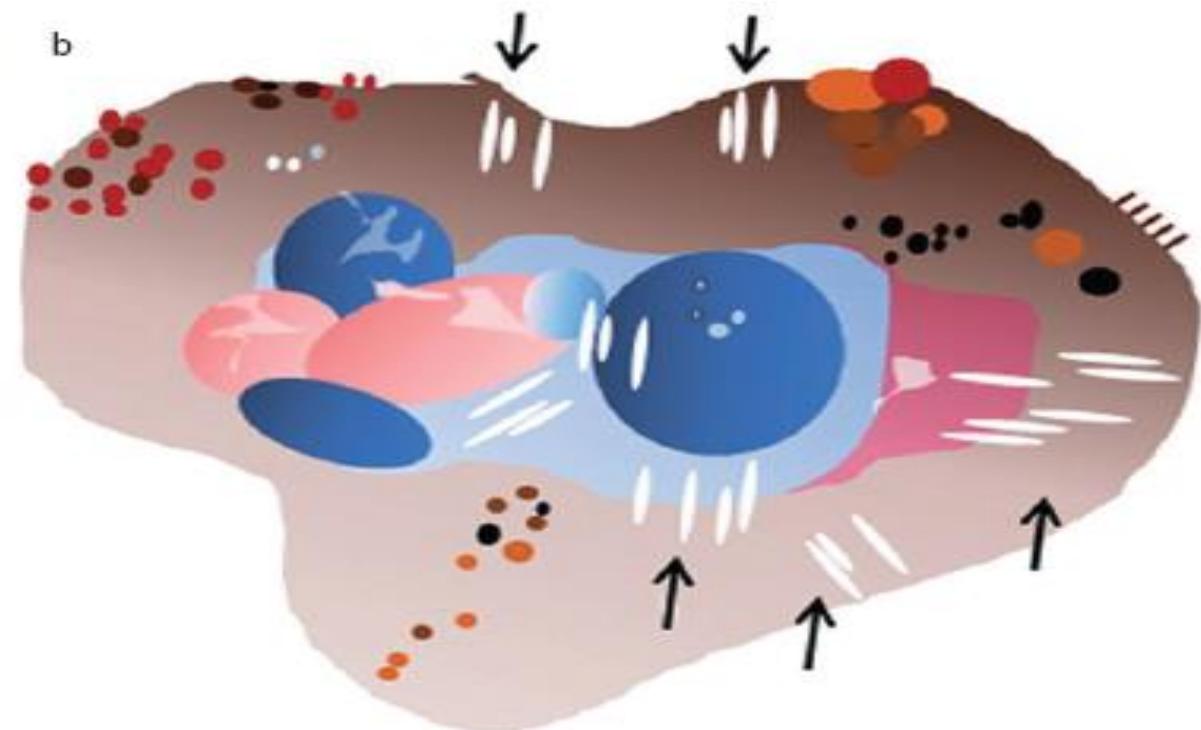

- Bozzolo della tarma della cera (della larva)

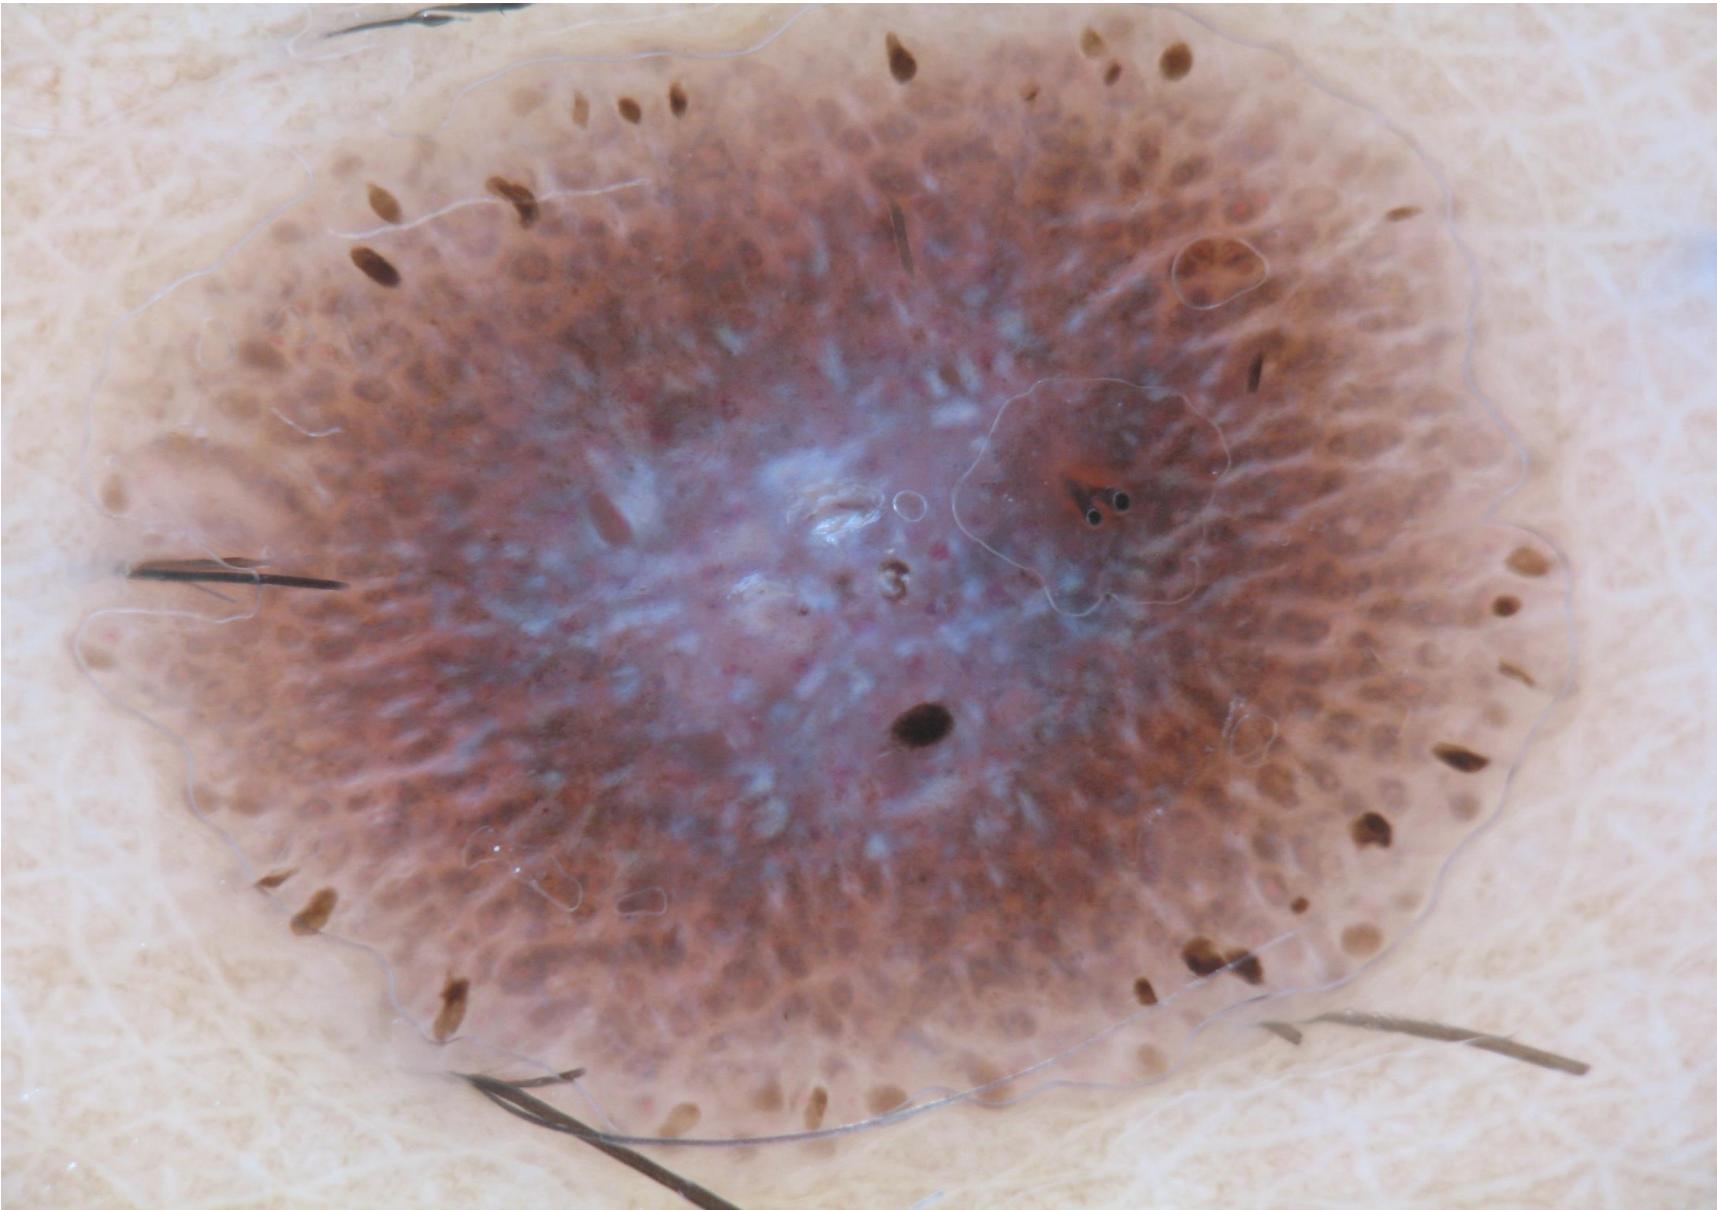

- Bozzolo della farfalla “del cactus”

Chrysalis = Shiny white streaks  
= Crystalline structures

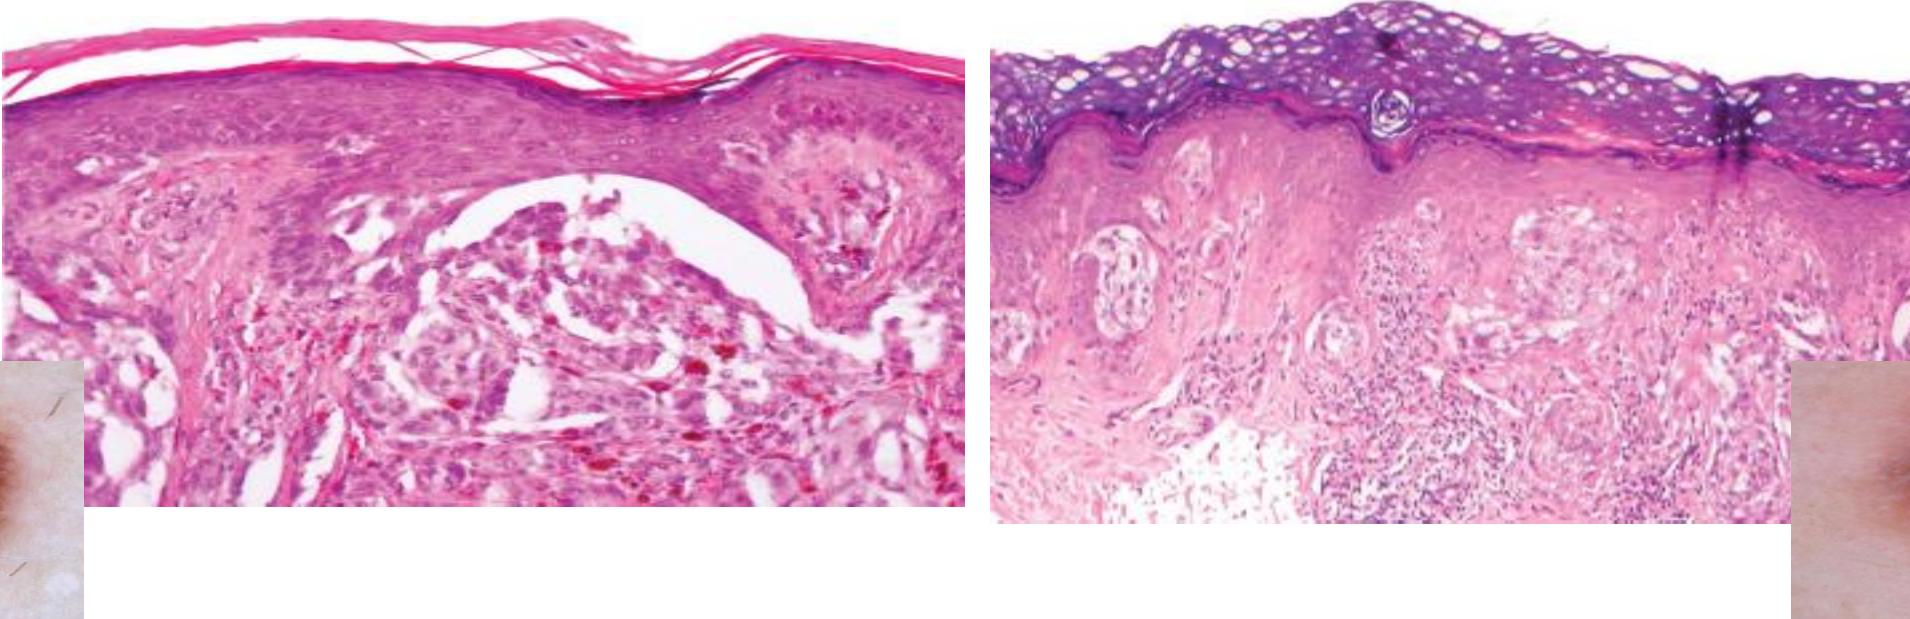

Le SWS vanno distinte dal reticolo invertito

Depigmentazione reticolare, con aspetto a rete, ad andamento serpiginoso

# Shiny-white streaks: correlato istopatologico

- Le SWS corrispondono alla interazione della luce polarizzata con il collagene birifrangente nel derma papillare
- Espressione di bFGF nel fronte di invasione del melanoma nel derma papillare (interazione stroma-melanoma)
- bFGF induce sintesi di collagene di tipo I

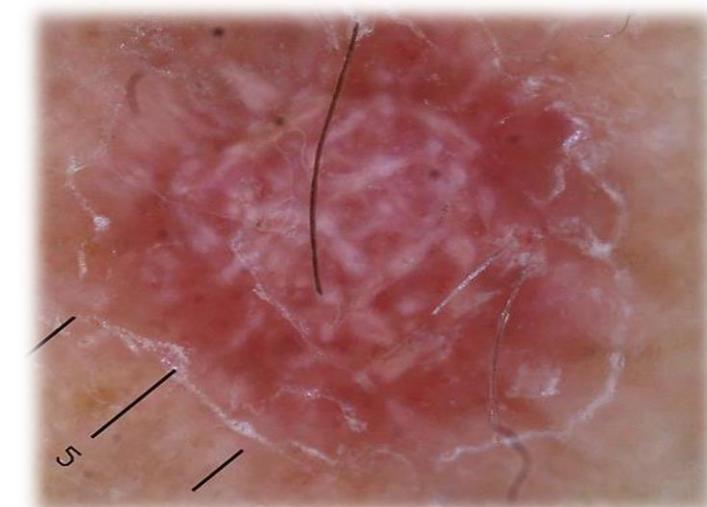

## Shiny white streaks: An additional dermoscopic finding in melanomas viewed using contact polarised dermoscopy

**Alessandro Di Stefani,<sup>1</sup> Terri M. Campbell,<sup>2</sup> Josep Malvehy,<sup>3</sup> Cesare Massone,<sup>4</sup> H Peter Soyer<sup>2</sup> and Rainer Hofmann-Wellenhof<sup>4</sup>**

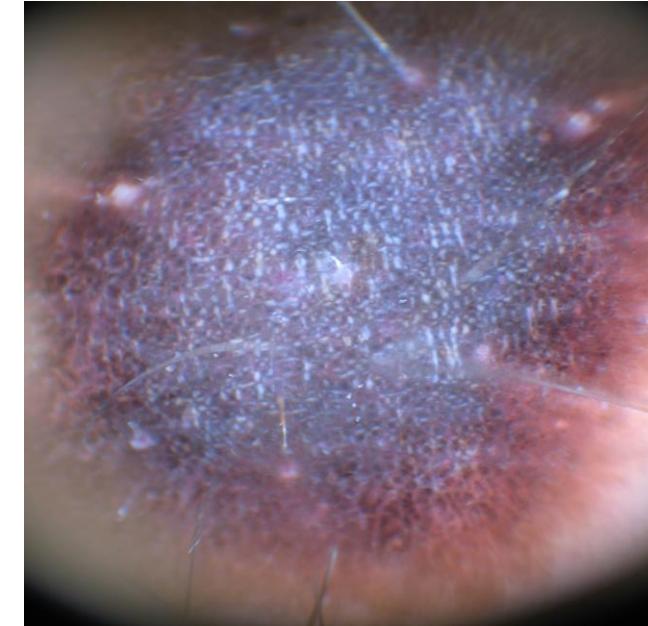

<sup>1</sup>*Department of Dermatology, University of Rome ‘Tor Vergata’, Italy;* <sup>2</sup>*Dermatology Research Centre, The University of Queensland, School of Medicine, Princess Alexandra Hospital, Brisbane, Australia;* <sup>3</sup>*Dermatology Department, Hospital Clinic, Barcelona, Spain; and* <sup>4</sup>*Department of Dermatology, Medical University of Graz, Graz, Austria*

- Obiettivo: studiare la frequenza delle SWS nelle lesioni melanocitarie
- Analisi retrospettiva di una serie consecutiva di:
- 400 Melanomi
- 400 Nevi (102/400 istologicamente confermati)

# SWS nelle lesioni melanocitiche: Risultati

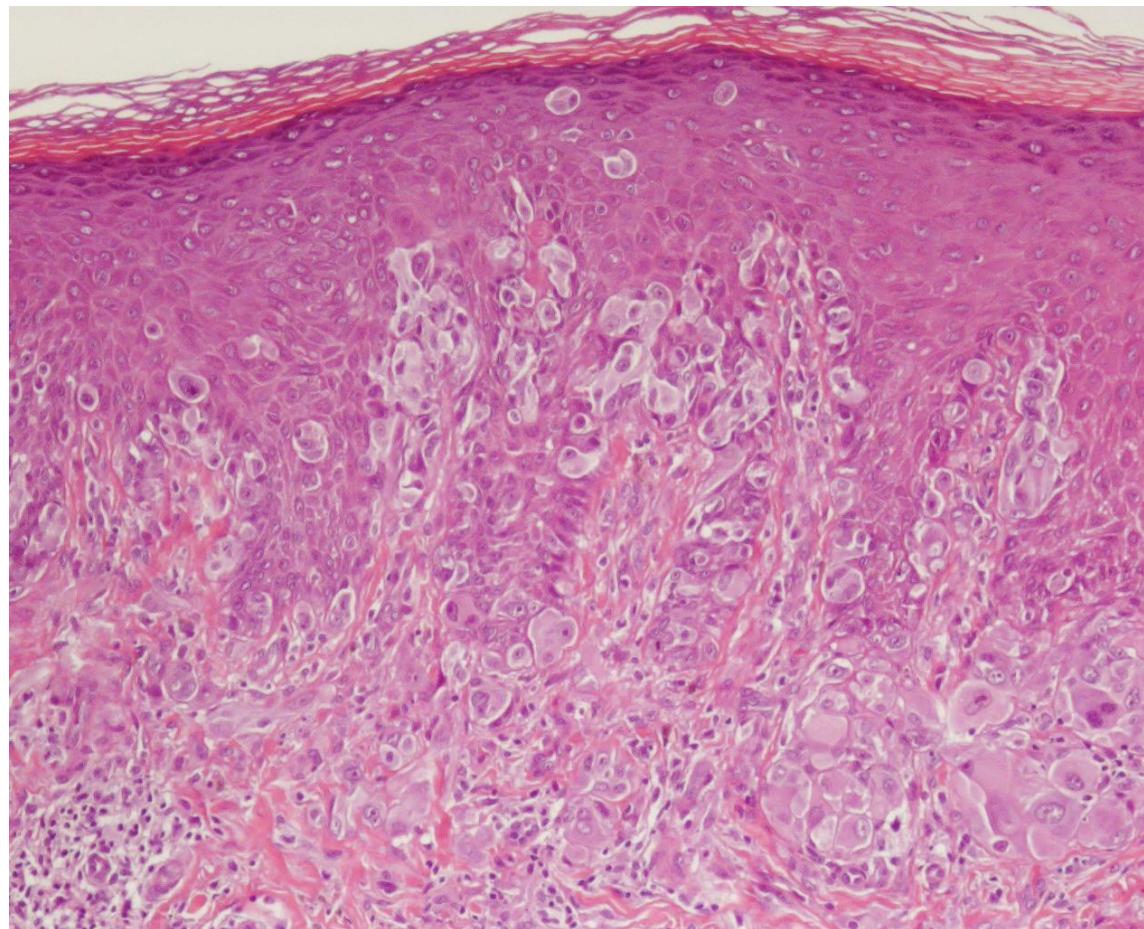

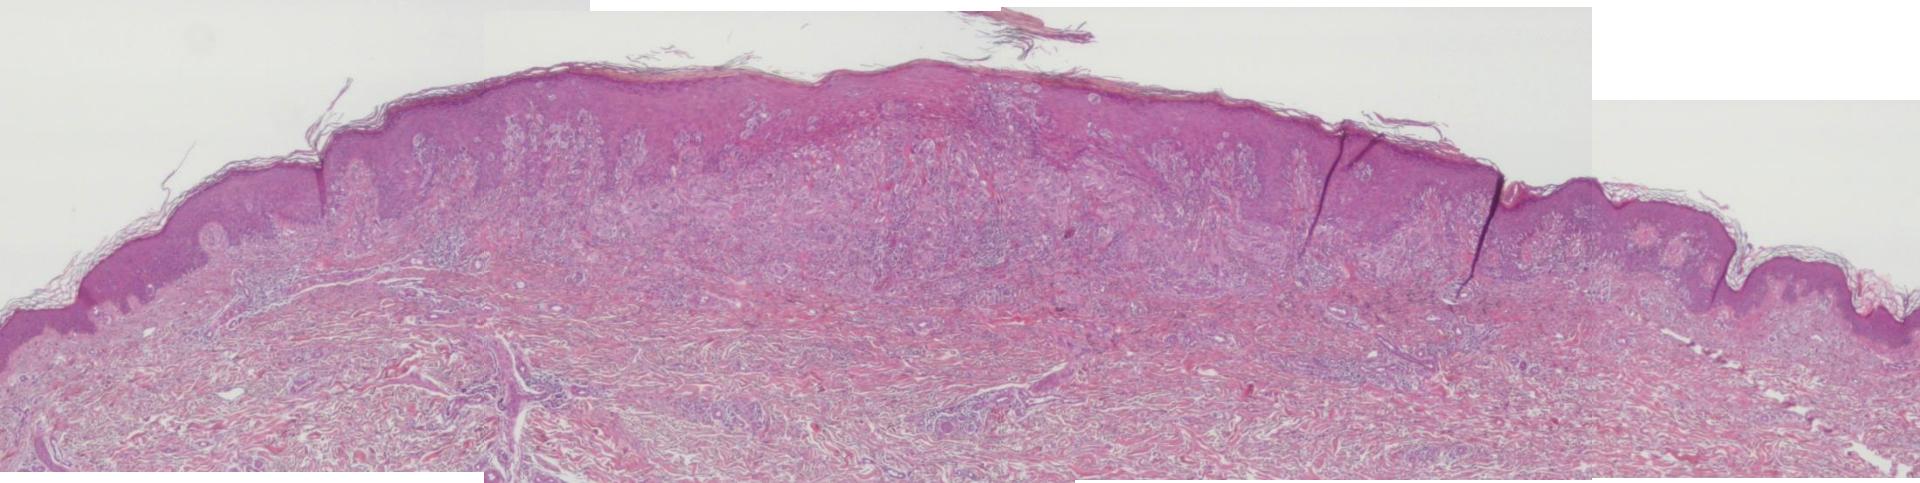

- La presenza delle SWS è stata identificata nel:
- 31.0% (124/400) dei melanomi
- 1.3% (5/400) dei nevi (2 Spitz, 2 blu, 1 Clark)
- Differenza statisticamente significativa ( $P < 0.05$ )
- 400 melanomi: Breslow medio di 0.87 mm
- 124 melanomi con SWS: Breslow medio di 1.27 mm
- 276 melanomi senza SWS: Breslow medio di 0.30 mm
- Differenza statisticamente significativa ( $P < 0.05$ )

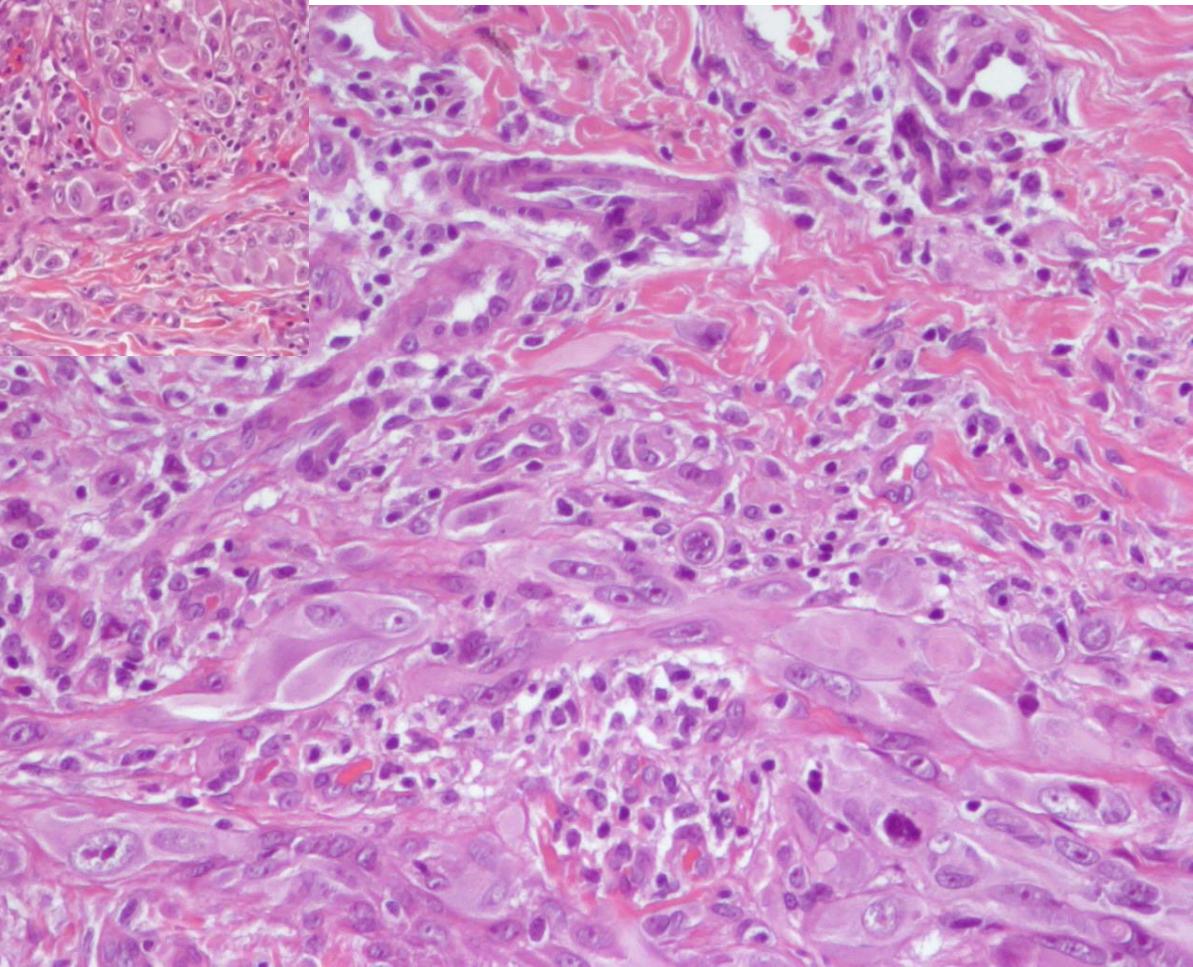

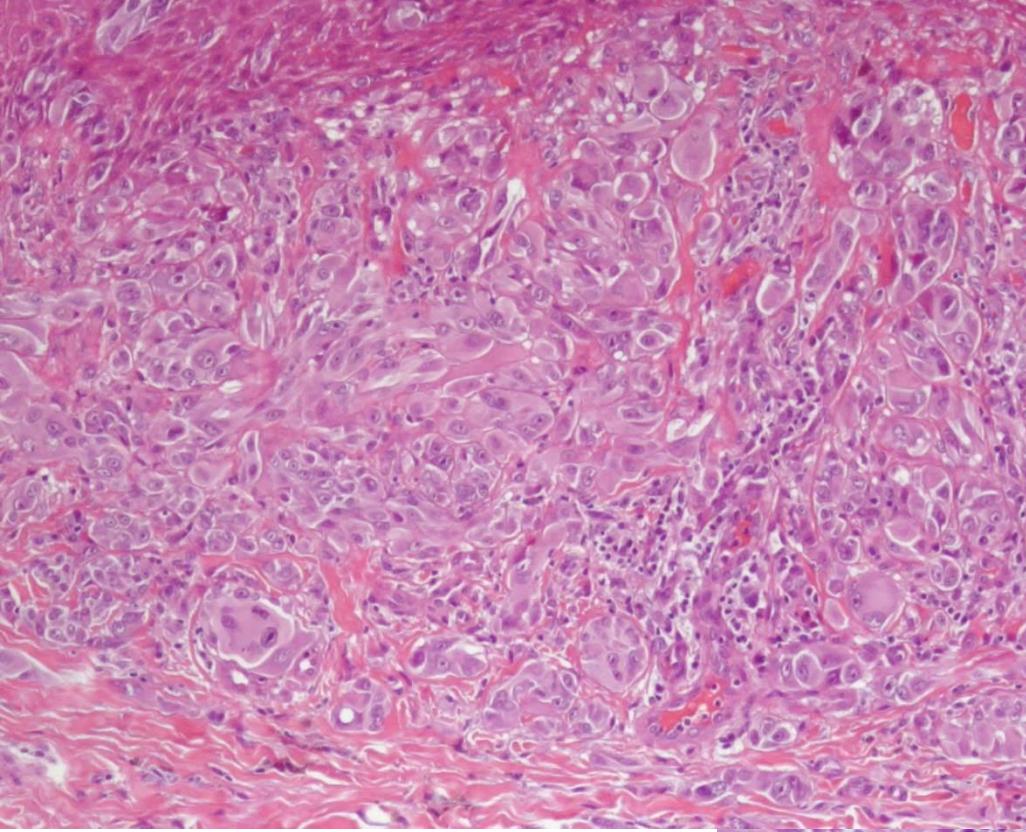

F 41 - coscia - Insorta da pochi mesi

# Presenza delle SWS nelle lesioni non-melanocitiche

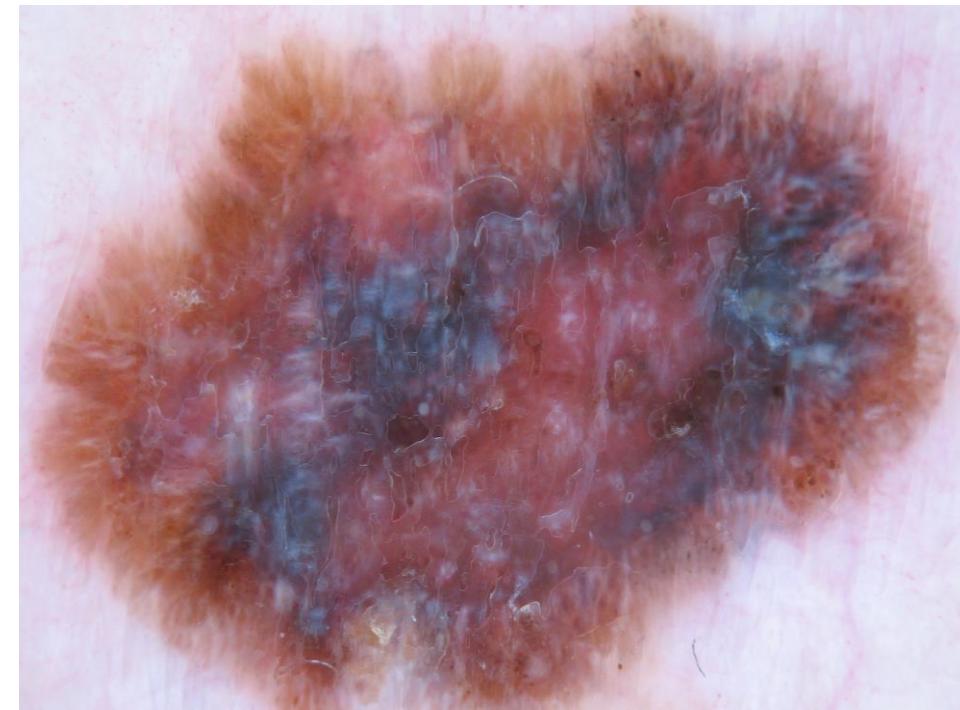

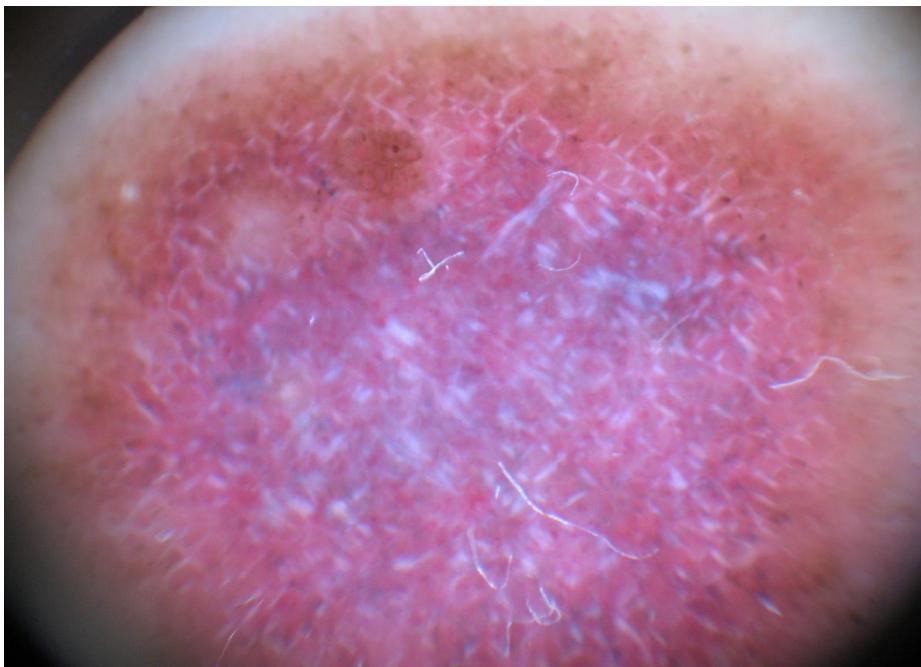

- Dermatofibromi
- Basaliomi
  - Fibroepitelioma di Pinkus
- Cicatrici
- Granulomi piogenici
- Cheratosi lichenoidi
- ...

*Le SWS non sono un criterio specifico di melanoma*

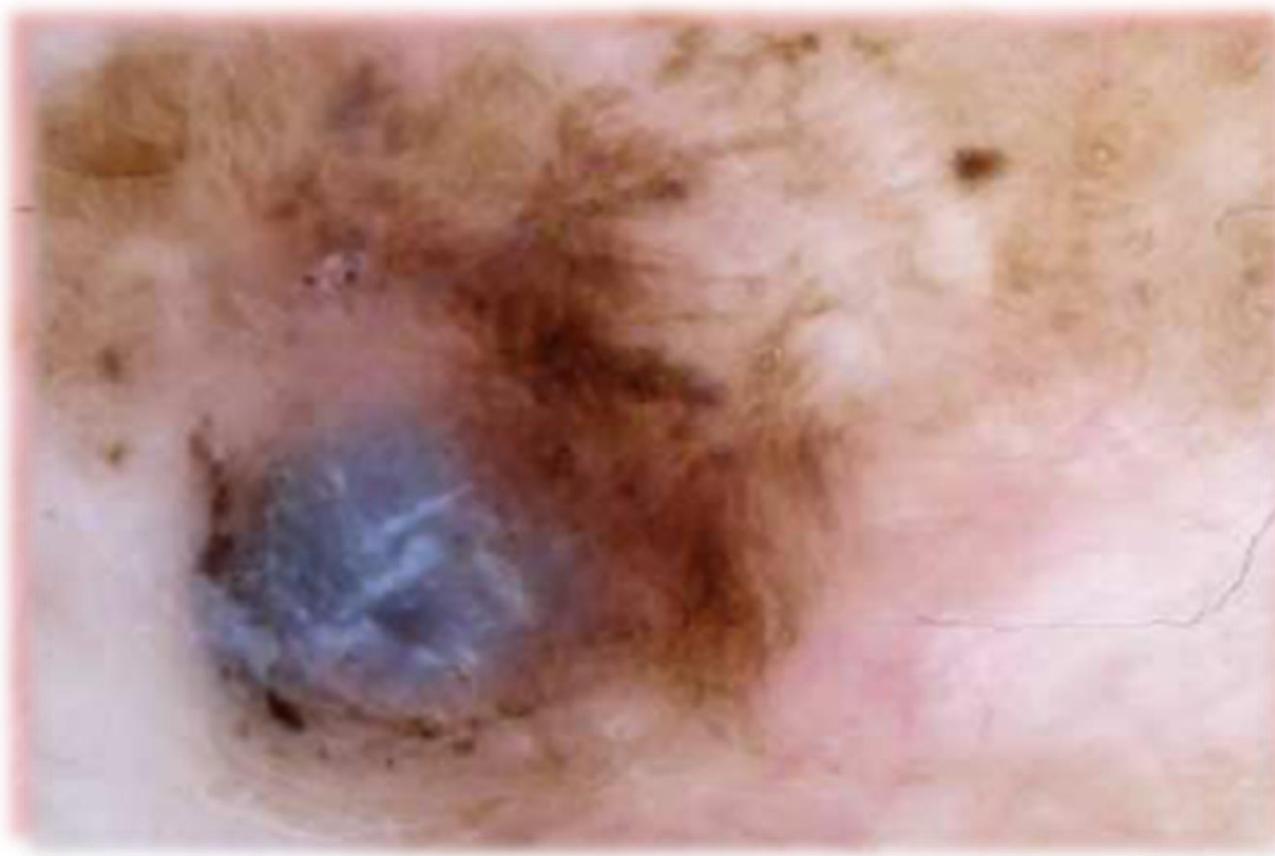

# SWS/crisalidi: resumè

- Le SWS non sono un criterio specifico di melanoma
- Ma possono rappresentare un criterio utile nella diagnosi di melanoma (spesso presenti)
- Specie se associate ad altri criteri che depongono per una natura melanocitaria

# The “blink sign”

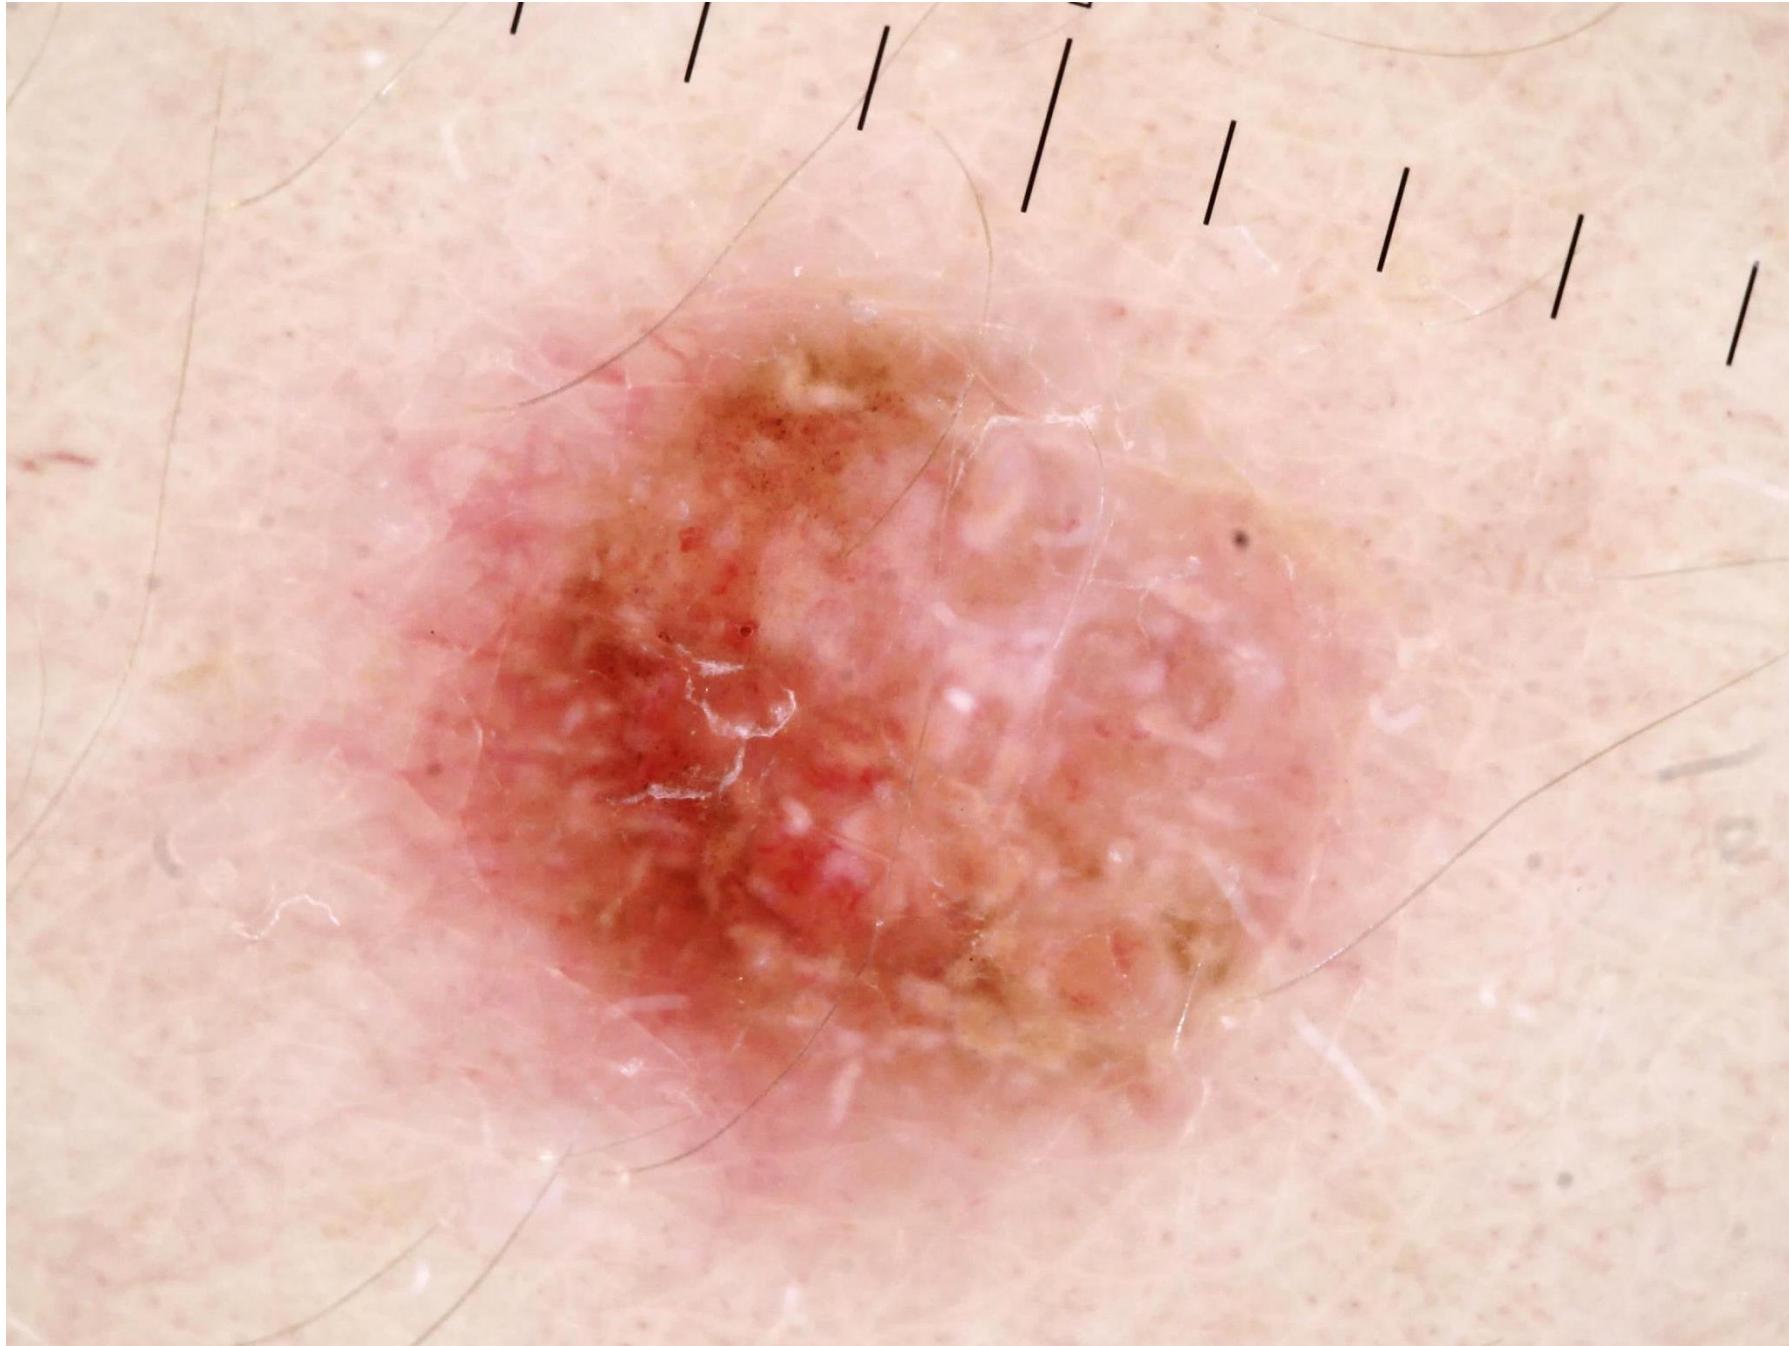

Visibile mediante i dermatoscopi ibridi che permettono di passare dalla modalità a luce non polarizzata alla modalità a luce polarizzata

F 37

# Le SWS non sono le uniche strutture biancastre identificabili con la dermoscopia
